## TABLE OF CONTENTS.

---

	PAGE
FOREWORD .....	5
CROPS, RECENT YEARS.....	9
<p>Illinois summary of the 1938 crops, statistical table showing acreage, yield, production, price and value for eleven years, 1928-1938; county estimates for important crops for 1937 and 1938.</p>	
LIVESTOCK .....	53
<p>Illinois summary of the 1939 estimates; county estimates of numbers and value January 1, 1937, 1938, and 1939; marketings and inshipments by months since 1930; number and value estimates for the State since 1867.</p>	
DAIRY AND POULTRY STATISTICS.....	81
<p>Illinois estimates of total milk production and utilization, creamery butter production, ice cream production, and American and other cheese production; evaporated and powdered milk production; milk production in herds of reporters by months. Data on numbers and value of chickens, production and value of chickens and eggs, and income; egg production in flocks of crop reporters, by months, since 1925.</p>	
ILLINOIS PRICES RECEIVED BY FARMERS.....	93
<p>Illinois and United States indexes of prices received by farmers; Illinois monthly prices received by farmers for 35 items; and monthly prices received by farmers by crop reporting districts for 14 items.</p>	
MISCELLANEOUS .....	149
<p>Illinois weather data; 1938 weather summary. Income from farm production; stocks of grain and hay on farms; stocks of wheat in interior mills and elevators; average time of planting, harvesting, and average rate of seeding per acre; weight per bushel of farm seeds; wages paid hired farm labor; Illinois corn by classes and winter wheat harvested by combines.</p>	
UNITED STATES STATISTICS.....	163
<p>Tables showing important data for the United States, including crop production, livestock numbers, chicken numbers, dairy products, grain stocks on farms, stocks of wheat in interior mills and elevators, farm income, real estate values, etc. Some of these data are shown by states.</p>	
INDEX .....	200

## FOREWORD.

---

Agriculture is continually faced with readjustment problems in its production and marketing programs in order to keep pace with the ever changing economic conditions. Reliable basic information is necessary if these changes are to be made most advantageously, and agriculture, like all other business, is demanding more and more that all facts bearing upon this great industry be made available as promptly as possible. The greatly expanded and practical use of county and state agricultural statistics in administering the national farm legislation and farm planning activities in Illinois is a recent example of the changing developments in the demand for and use of agricultural statistics.

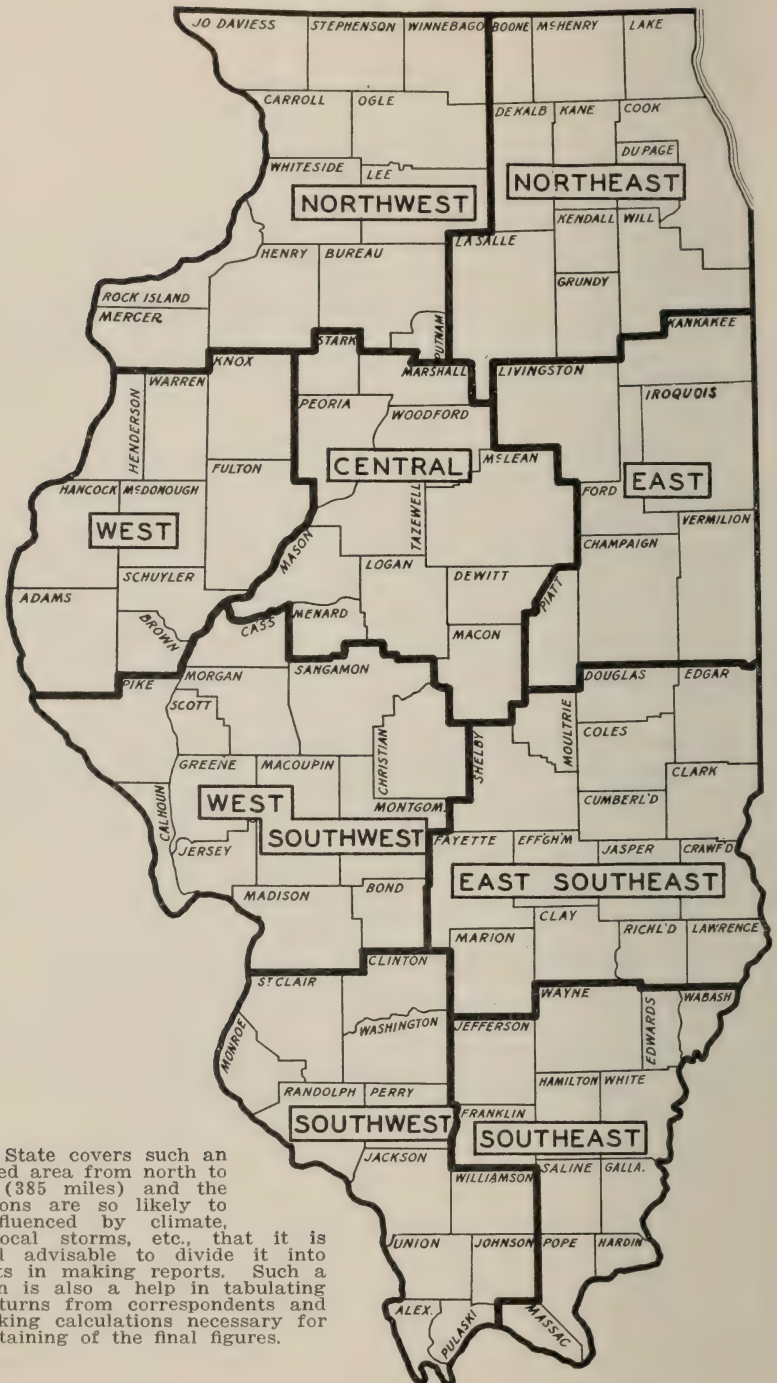

The Illinois Cooperative Crop Reporting Service is attempting to meet these needs in the most economical manner possible through the publication of this annual summary, "Illinois Crop and Livestock Statistics," Circular 440. This publication is not designed as a discourse except for the immediate past; it is rather a compilation of historical and current material and graphic representation intended to answer concisely a wide variety of inquiries. The general plan and content is similar to that of previous issues with the data grouped into six main sections as follows: Section 1, state and county crop data for recent years; Section 2, livestock statistics; Section 3, dairy and poultry statistics; section 4, Illinois prices received by farmers; Section 5, miscellaneous statistics; Section 6, United States statistics.

Agricultural statistics have been compiled by the United States Department of Agriculture since 1866. The Illinois Cooperative Crop Reporting Service represents the Illinois Department of Agriculture and the United States Department of Agriculture through a cooperative agreement effected in August 1925. The merging of the interests of these two departments into a single unit has made available much greater resources than could be commanded by each unit separately. The combined efforts and harmonious cooperation of the two departments have been largely responsible for the progress that has been made in recent years in Illinois agricultural statistics.

The regular publication of reliable agricultural statistics for Illinois as collected and distributed by the Illinois Cooperative Crop Reporting Service is dependent upon the voluntary cooperation of over 25,000 individual farmers and numerous commercial, educational, and governmental agencies in providing the basic data required. The Illinois and Federal Departments of Agriculture gratefully acknowledge the public-spirited cooperation which has made possible the issuance of this publication.

## OUTLINE MAP OF ILLINOIS.

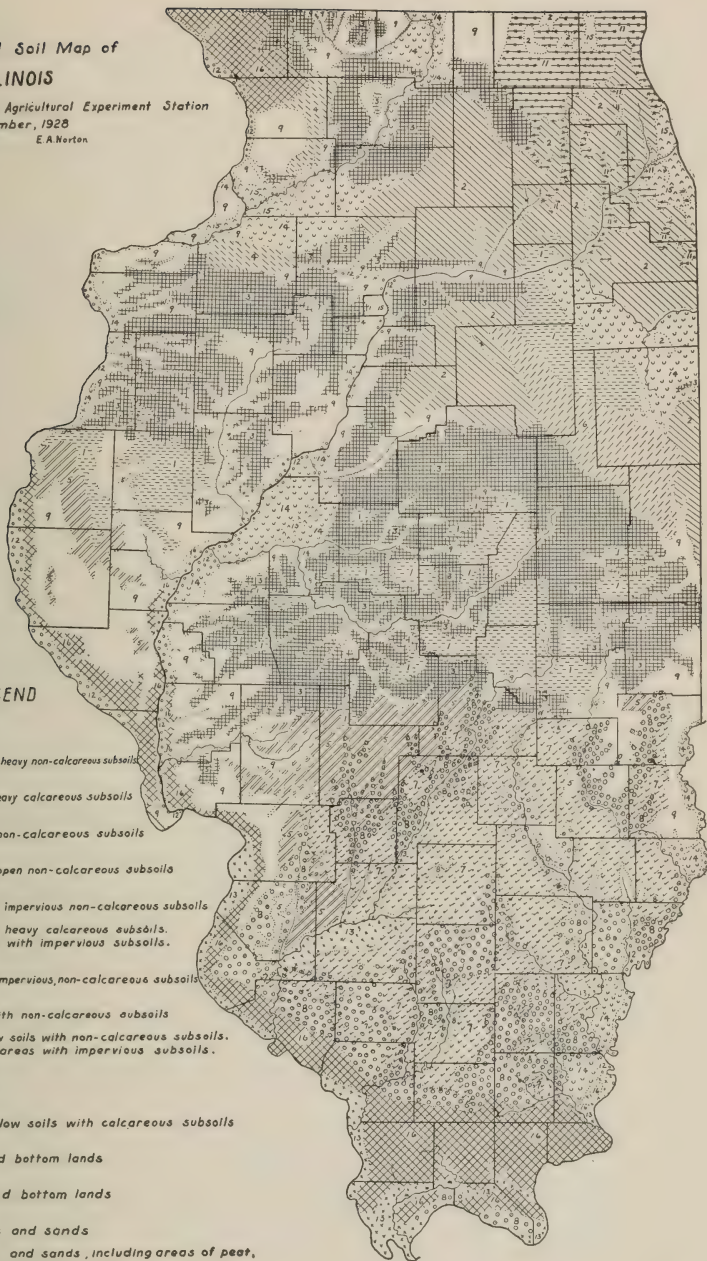

The State covers such an extended area from north to south (385 miles) and the conditions are so likely to be influenced by climate, soil, local storms, etc., that it is deemed advisable to divide it into districts in making reports. Such a division is also a help in tabulating the returns from correspondents and in making calculations necessary for the obtaining of the final figures.

## USE AND VALUE OF AGRICULTURAL STATISTICS.

---

Accurate crop acreage statistics are fundamental to reliable Illinois crop production statistics which are issued by the state and federal governments for the protection of the farmer. Agricultural statistics benefit all classes of people, especially producers, marketing and distributing agencies, because they relate to the essential facts of production and supply of food and raw materials and are unbiased, disinterested, and authoritative.

### Value of Agricultural Statistics:

#### (A) To Farmers:

##### *Directly—*

1. Indispensable for equitable administration of county and state farm programs for the benefit of the farmer by the state and federal governments.
2. Widely used by Federal Land Banks in administration of farm loan business in all counties.
3. Supplies an official agricultural business service.
4. Supplies the basic data for issuing agricultural outlook reports and part of data for all land utilization projects.
5. Guide to increasing or decreasing acreages of particular crops or livestock numbers.
6. Guide to marketing.

##### *Indirectly—*

1. Prevents issuance of biased, false, and misleading reports or minimizes their effect.
2. Reduces speculation the same as laws check but do not entirely prevent crime. Increased certainty of supply reduces wide price margins due to uncertainty.
3. Furnishes information permitting a better adjustment of prices in accordance with facts of supply and demand.

- (B) Cooperative Farmers Associations: Enables them to formulate constructive programs and policies, and market their products more advantageously.
- (C) Agricultural College and Extension Workers: Aids them in preparing crop and livestock production programs, also to measure the progress or success of their work.
- (D) Government, Financial Interests, and Insurance Organizations: Enables them to keep closely in touch with the needs of the agricultural industry.
- (E) Railroads: Enables them to estimate the number of cars that must be provided to facilitate the movement of agricultural products.
- (F) Manufacturers and Merchants: 1. Guide to locating supplies of agricultural products. 2. Guide to locating manufacturing plants.
- (G) Prospective Investors and Settlers: Guide to relative agricultural resources and advantages of the state.
- (H) Legislators: Furnishes authoritative state and county agricultural records for reference purposes and as an important basis for wise and constructive legislation with respect to agriculture.
- (I) National Government: In time of war.

# UTILIZATION OF HARVESTED ACREAGE (FIELD CROPS) ILLINOIS - 1938

## TOTAL ACREAGE OF PRINCIPAL FIELD CROPS LEADING STATES - 1938

## ANNUAL ILLINOIS CROP SUMMARY FOR 1938.

---

Large to record yields per acre for all of the leading crops except oats, an exceptionally good season for pastures, and ideal fall conditions for finishing and securing late crops were outstanding features of the 1938 crop season in Illinois. The quality of most of the crops was above average. All late crops matured ahead of fall frosts, which held off until October 22, which is unusually late.

Soybeans averaged 23.5 bushels per acre for the highest yield on record, and the tame hay yield of 1.48 tons per acre was the highest in 54 years. The corn yield of 45 bushels per acre was second only to the high record of 48 bushels in 1937. Winter wheat yield at 18.5 bushels was the best since 1931. Acre yields of barley, cowpeas, and potatoes were well above average and exceeded the good yields of these crops in 1937. Cloverseed and lespedeza seed turned out well on a record acreage. Yields of other crops were up to average or better with the exception of broomcorn, timothy, and sweet cloverseed. The production of peaches and grapes was near average. Apples and pears were uneven to light crops of varying quality.

The quality of corn and soybeans was excellent and above average for other crops except oats and hay. Rust and frequent rain interruptions in the later development stage and during harvest caused considerable variation in the quality of oats, and to a lesser extent, of spring wheat and barley. More than usual difficulty was experienced up to mid July down-State and up to mid August in the north in securing hay without rain damage. The favorable pasture condition from spring until early fall, and even later in the north, represents one of the most prolonged periods of good to surplus pasture feed on record. Large crops of corn and hay, plus a record carry-over of old corn and oats were the main factors contributing to an abundant feed situation quite generally. The relationship of feed prices to livestock prices remained profitable to livestock interests throughout the year.

The 1938 aggregate production of all grains exceeded the 10-year (1927-36) average tonnage by 27 percent, while all hay production was 25 percent higher and soybeans and cowpeas for grain were over three times larger than average. The tonnage of tree fruits, however, was about one-fifth less than the 10-year average. The total area of principal crops harvested in 1938 was estimated at 18,978,000 acres, compared with 19,986,000 in 1937; 19,391,000 in 1936; and the 10-year average of 18,953,000 acres. The total farm value of production of Illinois crops in 1938 was \$301,782,000, compared with \$381,930,000 in 1937; \$385,824,000 in 1936; and the 10-year average of \$305,219,000.

### CHARACTER OF THE SEASON.

January and February started out very favorably with above-average temperatures and more than normal precipitation. Subsoil moisture was rather short in January, but the frequent light rains during February, which soaked into the soil as frost was out of the ground quite generally, overcame this deficiency. March temperatures averaged 10 degrees above normal, making it the warmest March in 17 years. The month was marked by extremes, however, with central Illinois temperatures ranging from 20 degrees to 80 degrees. Frequent and above-normal precipitation hindered field work, particularly in the southern half of the State. Winter wheat, pastures, and other vegetation made remarkable growth.

The unseasonably warm weather of March was brought to an abrupt stop with severe cold weather, heavy snow, and blizzards during the first 10 days of April. Temperatures were as low as 24 degrees in Calhoun and Johnson Counties, where commercial fruit orchards were in bloom, and resulted in a materially reduced fruit prospect. The cold weather, coupled with above-normal precipitation during the first 10 days of April, held field work at a standstill. During the rest of the month, above-normal temperatures and light to moderate precipitation were favorable for advancing field work and plant growth. Corn planting started during the last week of the month in the southern third of the State. The 1938 planting season for spring-sown crops started earlier than usual and progressed well until about May 15. Then, frequent rains delayed planting work much of the time up to late June. Considering the early start, the seeding period was unusually prolonged. The greatly increased use of improved farm equipment, however, prevented the final completion date of seeding work from being unduly late.

The first half of May was cool with frosts on the 12th and 13th. Precipitation was below normal during the first half of the month and above normal during the last half, especially in the northern part of the State. Southern Illinois was becoming rather dry. Weather was good for plant growth in the northern two-thirds of the State. Frequent rains in the north delayed planting of part of the corn crop, although about 80 per cent of the State acreage was planted by May 31.

June was marked by frequent and heavy rains over most of the State. Temperatures were above normal through the 25th, while the last week of the month was unusually cool. Planting of that portion of the corn crop that was not planted in May was still further delayed. Cool nights retarded corn growth. Hay production was very heavy although rains made curing very difficult and resulted in quite a little poor quality hay. Small grains were rank and some rust appeared, particularly in oats. Winter wheat harvest started about June 15 in southern Illinois. Threshing and combining were well-advanced there by the close of the month.

Ample soil moisture coupled with above-average temperatures during July did much to overcome the handicap of that portion of the corn crop that was planted late. The frequent rains in the northern part of the State together with strong winds resulted in the lodging of a good deal of wheat, oats, and barley, as well as hastened the spread of red leaf rust, which cut oats yield materially. The southwestern part of the State continued dry and some corn on the thin land began to fire. Threshing and combining work made only fair progress and the quality of oats was lowered somewhat by rains.

August was hot and dry in central and southern Illinois, but there was plenty of rain in the northern part of the State. Farm work advanced normally except in the north, where frequent rains delayed small-grain harvest. Pasture conditions were good in the northern third of the State and fair in the central and southern areas. Conditions were ideal for soybeans. The peach crop turned out fairly well.

September was a warm and favorable month for growth and harvesting of late crops though adversely dry for plowing and preparing ground for fall grains. Precipitation was below normal except in the northern part of the State and was favorable for drying out corn and maturing soybeans. Pastures continued fair. Apples and pears were disappointing crops. Marketing started earlier than usual and quality was uneven.

October was rather dry and growth of fall grains started unevenly. Conditions continued ideal for maturing and securing late crops. Frost held off until October 22, allowing the late crops ample time to mature. Late corn in the northern part of the State came through with a surprisingly good crop. Continued dry weather delayed wheat planting and sharply lowered fall pasture condition. November was also rather dry though timely rains and unusually mild weather rapidly improved winter wheat and rye growth to nearly an average condition on December 1. The month of December opened with general moderate to rather heavy rains and weather continued comparatively mild up to the 26th. Precipitation for the month averaged somewhat below normal. The year closed with the condition of fall grains about

average and farm work unusually well-advanced. All livestock were reported in good condition. Farm feed supplies were ample to a surplus in all sections of the State.

### TRUCK CROPS.

The 1938 season was rather favorable for most commercial truck and vegetable crops. The total acreage of commercial truck crops including crops raised for manufacture and excluding market garden areas surrounding the larger cities was approximately the same as the 1927-36 ten-year average, but was about 25 per cent less than the acreage harvested in 1937. Yields per acre were for the most part above the ten-year average, but averaged about the same as 1937. Some crops yielded better, others about the same, and others not so well as in 1937. Quality mostly average fair. Prices were not as good as the ten-year average and were lower than in 1937. For some crops, such as cabbage, snap beans, and tomatoes, prices dropped below cost of harvesting during part of the season and as a result, quantities of these crops were allowed to rot in the fields. The total value of commercial truck and canning crops in Illinois excluding market garden areas surrounding the larger cities was estimated at \$4,522,000 for 1938, which is about 25 percent less than the total value for 1937, but is about 6 percent larger than the ten-year average value.

1935	19,075,680					326,668,000	
1936	19,391,450					385,824,000	
1937	19,986,080					381,930,000	
1938	18,977,530					301,782,000	

<sup>1</sup> To secure total planted soybean acreage add 94,000 acres for 1936, 108,000 acres for 1937 and 149,000 acres for 1938. For cowpeas add 16,000 acres for 1936, 5,000 acres for 1937 and 7,000 acres for 1938 which were plowed under or pastured. Estimates of acreage plowed under and pastured are not available for previous years.

<sup>2</sup> Pounds.

<sup>3</sup> December 1st price.

<sup>4</sup> Season average price 1929 to 1938.

<sup>5</sup> Per cwt.

<sup>6</sup> Per thousand.

<sup>7</sup> The average value per acre of all crops, excluding fruits, listed in the above Illinois crop summary table is: 1928, \$23.26; 1929, \$20.84; 1930, \$13.63; 1931, \$8.84; 1932, \$9.10; 1933, \$11.38; 1934, \$14.39; 1935, \$16.67; 1936, \$19.74; 1937, \$18.62; 1938, \$15.63.

# **Illinois Livestock Statistics**

---

# GROSS FARM VALUE OF ILLINOIS LIVESTOCK JANUARY 1, 1939

## AGGREGATE VALUE OF LIVESTOCK CATTLE, HOGS, SHEEP, HORSES, AND MULES LEADING STATES - JANUARY 1, 1939

## JANUARY 1, 1939, LIVESTOCK REPORT FOR ILLINOIS.

An increase in the numbers of all cattle, hogs, and sheep and a slight decrease in the number of horses on Illinois farms January 1, 1939, in comparison with numbers reported a year earlier is shown by the annual inventory estimates of livestock. The tendency to expand production of meat animals is shown by reported increases of 2 percent for cattle, 7 percent for hogs, and 3 percent for sheep. The number of horses declined 6 percent, while mule population was unchanged. The number of milk cows, which is included in the total for all cattle, increased 1 percent.

The combined total of horses, mules, cattle, hogs, and sheep of all ages on Illinois farms January 1, 1939, was 8,871,000 head, or about 4 percent larger than the total of 8,546,000 head reported a year earlier. Their total inventory value of \$256,087,000 was 1 percent larger than the \$253,790,000 reported a year ago. The values per head of all species, except cattle, were lower than a year earlier.

The estimated number of horses, including colts, was 661,000 or a decline of 6 percent during 1938. For the first time in several years the number of colts under 1 year of age on January 1 was smaller than the previous year, indicating a further decline in horse numbers can be expected in 1939. The peak of Illinois horse population was reached in 1913, when 1,522,000 head were on farms, but a steady annual decline has reduced that number 57 percent in 25 years to the present total of 661,000 head. Compared with a year ago, the average value per head of \$87.00 is down \$6.00 and total value of all horses of \$57,182,000 is 13 percent smaller. With an average value of \$105 per head, the 98,000 mules on farms were valued at \$10,292,000, or about 5 percent less than valuation a year ago.

The number of cattle on farms January 1 was 2,699,000 head, an increase of 2 percent over the previous year. The increase was largely in yearling heifers and calves with steers and beef cows showing about a 6 percent decrease. An increase of \$2.30 in average value per head coupled with larger numbers, resulted in a total value of \$123,189,000 compared with \$114,515,000 a year ago. Cows and heifers two years old and over kept for milk are estimated at 1,134,000 head, representing a value of \$70,308,000, for an increase of 1 percent in number and 6 percent in total value over last year. The number of yearling heifers being kept for milk cows increased 7 percent and heifer calves being kept for milk cows increased 4 percent.

Total hog numbers in Illinois January 1 were estimated at 4,423,000 head, an increase of 7 percent over last year. Pigs under 6 months old increased 18 percent, sows and gilts registered a 13 percent increase, while the number of other hogs decreased 8 percent. Total number now on hand is the largest reported since 1934, when there were 5,260,000 head. Value per head was \$13.30, or 30 cents less than a year ago, but the material increase in numbers accounted for a total value of \$59,017,000, or a 5 percent increase over last year.

The number of sheep and lambs in Illinois January 1 increased 3 percent over a year ago to total 990,000 head, of which 295,000 were on feed. A year ago there were 965,000 head, with 290,000 on feed for market. An average value per head of \$6.50 was 30 cents lower than a year ago, while the total value of \$6,407,000 was \$131,000 smaller.

Chickens on Illinois farms January 1 totaled 22,439,000, or 4 percent more than a year earlier. They had an average value of 71 cents for a total value of \$15,932,000 compared with 83 cents and \$17,965,000 a year ago.

LIVESTOCK OF ALL AGES ON FARMS AND IN FEED LOTS JANUARY 1, 1932, 1933, 1934,

### UTILIZATION OF WHOLE MILK PRODUCED ON ILLINOIS FARMS - 1937

### GROSS INCOME FROM MILK PRODUCTION LEADING STATES - 1937

## ILLINOIS DAIRY STATISTICS.

Illinois is an important dairy State ranking sixth of all the states in gross income from milk production in 1937. During 1938 Illinois ranked sixth in average number of milk cows on farms, and since average milk production per cow was high, ranked fifth among the states in total milk produced. The average number of milk cows on Illinois farms during 1938, excluding heifers that had not freshened, was 1,075,000, and total milk produced on farms during the year is estimated at 5,106 million pounds. Data showing the production of milk and other dairy products, and farm value and utilization of milk produced on farms are shown in the following tables:

ILLINOIS MILK AND BUTTERFAT PRODUCTION AND VALUE—1929-1938.

Year.	Cows milked.	Annual production per cow		Total annual production.		Farm value of milk produced on farms.	Farm butter production.
		Milk.	Butter-fat.	Milk.	Butter-fat.

\* Figures are not estimates of production but merely averages calculated by dividing the reported daily milk production of herds on about the first day of each month by the number of cows milked and all milk cows, respectively, in herds kept by crop correspondents.

ILLINOIS MILK PRODUCTION PER COW  
ON FIRST OF EACH MONTH<sup>1/</sup>

## ILLINOIS POULTRY STATISTICS.

Illinois ranked third in number of chickens on farms January 1, 1939. Thirty-five million or more chickens are usually raised and over one and one-half billion eggs produced annually in the State. The cash income from the sale of chickens and eggs during 1937 amounted to 7 per cent of all cash farm income. Income from the sale of eggs exceeds that from the sale of chickens each year. There are chickens on 95 per cent of all farms in Illinois.

**ILLINOIS CHICKEN NUMBERS  
OVER 3 MONTHS OLD  
JANUARY 1, 1935.**

The distribution of chickens over the State is quite uniform with some concentration of numbers in the upper group of southeastern counties and the dairy areas of northern Illinois. Practically every farm in the State keeps at least a small flock for home consumption. Although the farm consumption of chickens and eggs is large, the cash income from the sale of these products amounts to about 10 per cent of the total Illinois cash farm income. On the average about one-fourth of the chickens in Illinois farm flocks are light breeds and three-fourths are heavy breeds.

**ILLINOIS EGG PRODUCTION  
1934.**

The distribution of egg production throughout the State follows very closely that of chicken numbers, being heaviest in upper southeastern Illinois, the dairy region of northern Illinois, and a group of counties southeast of St. Louis. Production per hen is somewhat higher in commercial poultry flocks than in general farm flocks, thus magnifying the concentration.

**Illinois Prices  
Received by Farmers**

---

---

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

ALL PRODUCTS

This chart shows the general movement of Illinois prices received by farmers as represented by the prices of twenty-one important products which account for approximately 94 percent of the cash income to Illinois farmers. The 100 percent line is the average of the prices of these products for the period 1910 to 1914, and the position of the index at any time shows the relation of Illinois prices received by farmers at that time compared with prices during the five years 1910 to 1914. The actual figures by months and years are given in the table on page 97.

## UNITED STATES INDEX OF PRICES RECEIVED BY FARMERS

(August, 1909-July, 1914 = 100 per cent)

ALL PRODUCTS

United States prices received by farmers have fluctuated since 1910 as shown in the above chart. The base period is taken for the five years ending in July, 1914, and the monthly prices are shown as a percent of this period. Because of the large number and wide distribution of products included, the index does not fluctuate as much as indices for smaller areas. The actual figures by months and years are given in the table on page 97.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS.

The index of prices received by Illinois farmers for their products from 1910 to the present time is shown on the opposite page. The general level of prices received by Illinois farmers was quite stable from 1910 until early in 1916 when a strong rise started. By the middle of 1917 prices were approximately twice the pre-war, 1910-1914, level. This high level was maintained until the middle of 1920 when a precipitous decline commenced. This decline brought prices of farm products down to the pre-war level late in 1921. Upward reaction soon raised Illinois prices received by farmers to a level 15 to 20 percent above pre-war which was maintained until the summer of 1924. The index shows that prices from 1925 through 1929 fluctuated within rather narrow limits between 25 and 50 percent above the 1910-1914 average. Then followed the drastic decline which continued until prices reached a point 50 percent below the pre-war period of stability. The sharp advance in farm prices which started in April, 1933, continued with some minor setbacks until August, 1937. During the last four months of 1937 prices dropped rapidly to a point just slightly above the pre-war average. Since December, 1937, the general level of prices received by Illinois farmers has shown a slight downward tendency, but for the most part has fluctuated between 90 and 100 percent of the 1910-1914 average.

The general level of prices received by farmers in Illinois has been quite similar to the level of the United States prices received by farmers during most of the 1910-1937 period. There was some disparity in the period from 1922 to 1924 when the United States level was higher than that of Illinois. This difference was largely due to the effect of cotton prices.

The prices used in the preparation of the Illinois index of farm prices are published on the following pages and are the prices obtained by the United States Department of Agriculture through the Illinois Cooperative Crop Reporting Service from reporters throughout the State. These are estimates of prices received by farmers.<sup>1</sup> The 1910-1914 average prices are taken as base prices since this is the most recent period of required length in which a reasonable degree of price equilibrium has existed. A base price for soybeans has been established by converting the 1930-1934 average soybean price on the basis of the relationship which existed between the 1930-1934 average price of other grains and their base price. Therefore, the index numbers show combined prices of farm products as a percent of the 1910-1914 average, which is referred to as the pre-war period. Many other farm price indices employ this same base period which makes them directly comparable with the one here published for Illinois.

Prices of twenty-one important and representative Illinois farm products are used in calculating the index. The average cash farm income from these twenty-one products amounts to approximately 94 percent of the total Illinois cash farm income. The index is described as one of weighted aggregates and is calculated in the same manner as the United States index of prices received by farmers.<sup>2</sup> The commodities are combined in the index so that each product with the exception of soybeans influences the index in proportion to its average importance as a source of cash income to Illinois farmers during the period 1924-1928.<sup>3</sup> The weight given soybeans is based on the average farm sales for the period 1930-1934 as this is considered the most representative period of soybean sales to date. The index accordingly measures the percentage relationship between the value of given quantities

<sup>1</sup> "Reliability and Adequacy of Farm Price Data," by C. F. Sarle, U. S. Department of Agriculture, Department Bulletin No. 1480.

<sup>2</sup> "Crops and Markets Supplement," U. S. Department of Agriculture, August, 1924, page 285.

<sup>3</sup> "Farm Value, Gross Income, and Cash Income from Farm Production, 1924 to 1928," A Preliminary Report, March, 1930, Part I—Sections 1 and 2, published by the Bureau of Agricultural Economics, U. S. Department of Agriculture.

of agricultural products at the prices prevailing at any given time and the value of the same quantities at prices in the base period, 1910-1914. The following Illinois products are used in the index. The quantities given are estimates of average annual amounts sold from Illinois farms during the five-year period, 1924-1928.\*

Grains—		Meat Animals—	
Corn .....	130,453,000 bu.	Hogs .....	13,291,000 cwt.
Wheat .....	29,078,000 bu.	Cattle .....	9,114,000 cwt.
Oats .....	67,209,000 bu.	Calves .....	704,000 cwt.
Barley .....	4,737,000 bu.	Sheep .....	76,000 cwt.
Soybeans .....	4,914,000 bu.	Lambs .....	524,000 cwt.
Fruits—		Chickens and Eggs—	
Apples .....	5,299,000 bu.	Chickens .....	101,032,000 lbs.
Peaches .....	735,000 bu.	Eggs .....	105,783,000 doz.
Miscellaneous—		Dairy Products—	
Hay .....	803,000 tons	Milk .....	18,266,000 cwt.
Horses and Mules...	25,000 head	Butterfat .....	43,907,000 lbs.
Wool .....	3,657,000 lbs.	Butter .....	5,680,000 lbs.
Potatoes .....	2,619,000 bu.		

The commodities of the index are separated into related groups as shown in the preceding table and separate indices are presented in tabular and chart form for these groups on the following pages. Meat animals are the principal group with hogs and cattle the major products. Grains have a large influence on the index with corn value amounting to over half of the group value. The index therefore closely follows a trend representing the average of these two important groups. The six commodity groups influence the index as follows:

Grains .....	34.4 percent
Fruits .....	1.6 percent
Meat Animals .....	40.8 percent
Chickens and Eggs .....	8.4 percent
Dairy Products .....	10.3 percent
Miscellaneous .....	4.5 percent
Total .....	100.0 percent

The charts on page 98 show Illinois and United States prices received by farmers stated in terms of their ratio to prices farmers in the entire country have to pay for commodities used by them in the household and in their program of production. The index of prices paid by farmers for the United States, which is shown in the chart on page 100, is constructed to measure changes in prices of goods bought for use in farm production and in the farm home, and to show the relation of the price levels at any given time to those which prevailed in the five-year period, 1910-1914. However, this index number series does not measure changes in farm expenditures but merely shows changes in the value of a fixed bill of goods from year to year and month to month. Hence, the index of prices received by farmers when divided by the index of prices paid by farmers, or the ratio of prices received to prices paid, does not measure the purchasing power of the farmer. It represents, however, the amount that a given quantity of selected farm products would purchase of a given quantity of goods farmers buy in relation to what they would purchase in the base period.

The ratio of prices received to prices paid fluctuated around 100 during the period 1910-1916. Then for about three years the prices of farm products were well above the prices of commodities purchased, which was a period of real prosperity for agriculture. With the drop in prices of farm products in 1920 this advantage was lost and the period from 1921 to 1924 was very unfavorable. From 1925 to 1930 the ratio was somewhat higher but farmers were required to spend about one dollar for ninety cents worth of products even during this period of general business and industrial prosperity. The decline in farm product prices from 1930 through 1932 was much more rapid than the decline in prices asked for farm supplies, and as a result the ratio of farm prices received to prices paid dropped to an extremely low level early in 1933. After that time the ratio generally improved until in August, 1936, it stood at 107. It fluctuated around that point through September, 1937, and then the ratio dropped rapidly to 84 in November, 1937. The ratio of prices received to prices paid has shown a slight downward tendency since that time.

\* Soybeans represent the average farm sales during 1930-1934.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

RATIO OF PRICES RECEIVED TO PRICES PAID

The index above provides a comparison of the prices received by Illinois farmers any given time and the prices they are being asked to pay for products needed for the household and in production. The index of prices paid by farmers is on an annual basis from 1910 to 1922 and on a monthly basis since February, 1923. When the index is above 100 per cent, then prices received are higher compared with the 1910 to 1914 average than are prices being paid. A ratio below 100 per cent indicates that prices received are comparatively lower than prices to be paid. For further discussion see page 95. The actual figures are given in the table on the opposite page.

## UNITED STATES INDEX OF PRICES RECEIVED BY FARMERS

RATIO OF PRICES RECEIVED TO PRICES PAID

The United States ratio of prices received to prices paid by farmers employs the same set of prices being paid by farmers as the above index for Illinois, but the prices received are those representing the entire United States as shown in the chart on page 94. The actual figures are given in the table on the opposite page.

<sup>1</sup> Based on United States Index of prices paid by farmers.

## UNITED STATES INDEX OF PRICES PAID BY FARMERS

ALL ITEMS

The index number series of prices paid by farmers is constructed to measure changes in prices of goods bought for use in farm production and in the farm home, and to show the relation of these price levels to those which prevailed in the 5-year period 1910-1914. Local dealers in all parts of the United States report prices upon schedules furnished by the Division of Agricultural Statistics of the United States Department of Agriculture. The averages of prices for the United States are combined according to their relative importance as determined by average quantities of commodities purchased per farm or per farm family in the 6-year period 1924-1929.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

GRAINS

The Grain index shown in the above chart includes the prices of corn, wheat, oats, barley, and soybeans combined according to their importance as a source of cash income to Illinois farmers. Grain prices fluctuate considerably and at rapid rates. During the recent period of low prices this index reached a lower point than any other commodity group. However, from August 1936 through July 1937 this index was at a higher level than any other commodity group. It then dropped rapidly until in December it was one of the lowest of the commodity groups. The table below shows the monthly and annual figures of the grain index.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

MEAT ANIMALS

Prices for hogs, beef cattle, veal calves, sheep, and lambs are included in the above index. Hogs are the most important single source of income to Illinois farmers which income during the period 1924 to 1928 averaged nearly a hundred million dollars per year. This index has more influence on the all commodities index than any other commodity group.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

CHICKENS &amp; EGGS

The Chickens and Eggs index shows a large amount of seasonal variation with highest prices usually during the winter months. The prices of chickens and eggs have averaged higher during the period since the world war than most other products. Compared with other commodity groups, chickens and eggs were especially high during the 1921 to 1924 period.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

## DAIRY PRODUCTS

The dairy products index shown in the chart above shows a uniform seasonal variation, reflecting the seasonal variation in dairy production. This index includes the prices of milk, butterfat, and butter since 1921, while previous to 1921 butterfat was converted into butter equivalent, and butter price used to represent dairy products other than milk. Similar to chickens and eggs, dairy products have been maintained at a higher price level since 1921 than the grain and livestock groups.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

FRUIT

The Illinois index of fruit prices is represented by the prices of apples and peaches. The above index shows a rather regular annual change or seasonal variation because of the seasonal conditions of production and semi-perishable nature of fruits.

## 1938 WEATHER SUMMARY FOR ILLINOIS.

By E. W. HOLCOMB, *State Meteorologist.*  
UNITED STATES WEATHER BUREAU.  
Springfield, Illinois.

### GENERAL SUMMARY.

Illinois averaged warmer in 1938 than in any year since 1931, and this was the third warmest year in the climatological history of the State. June was the only month with a temperature deficiency. February and March were exceptionally warm, and August and October were quite warm. The August warmth was intensified somewhat by periods of unusually high humidities. The last killing frost of spring occurred about April 10th, except over much of the northern division and in areas of the extreme eastern portion of the central division where it was recorded on May 12th or 13th. The first killing frost of autumn generally came on October 24th, although at a few central and northern stations it did not take place until about two weeks later.

Sunshine was very deficient in February, while October was exceptionally sunny, and November had about one-third more clear days than normal.

Precipitation for the State for the year averaged 3.94 inches above normal, only 3 central and 13 southern division stations totaling less than normal for the year. During the forepart of the year and including July amounts generally were adequate, and for considerable periods of time involving wide areas precipitation was too heavy. In contrast the last four months of the year were mainly too dry, the deficiency being rather critical at times over considerable areas. Amounts of precipitation averaged 158% of normal in February and March, 134% in May, June and July, and 76% in September, October, November and December. Showers of July and August were mainly of a local character and in consequence distribution of amounts over the State was irregular. September's rainfall was heavy over much of the northern division, while elsewhere amounts were generally deficient.

Tornadoes, windstorms, hail and lightning of March took a known death toll of 24 persons, injured about 170 others, and did property damage estimated at about \$2,247,500. Other tabulated losses during the year from weather causes, including floods, were estimated to have exceeded \$2,000,000. Sleet and freezing rain affecting wire facilities in portions of north-central Illinois about April 7th represents about \$500,000 of the last mentioned figure.

Mildness and generally ample to abundant precipitation during the forepart of 1938 were very favorable factors in promoting good growth of winter crops, and in inducing rapid growth of grasses and spring sown crops, which together with mostly favorable summer conditions contributed to a most satisfactory agricultural season. Wetness of soil in May slightly delayed corn planting and retarded proper cultivation in areas, but both during June and July conditions were very favorable generally for progress of corn, and preponderance of fair weather in the fall matured an excellent crop well in advance of frost and permitted its gathering to proceed with unusual rapidity. It was too dry in many central and southern areas during September and October for fall plowing and preparation of seed-beds, and considerable winter wheat was sown later than desirable. Germination of fall sown grains in areas was also slow because of dryness and there was considerable complaint in many instances of plants being small; however, at the close of the year winter crops in general were mostly in average to good condition. Weather conditions in November and December allowed considerable field operations, including plowing, and the year closed with farm work exceptionally well advanced. The favorable late-season weather conditions likewise permitted much foraging by livestock, conserving the already ample feed supply. During the closing months of the year there was considerable complaint of deficient subsoil moisture, particularly in parts of the central division.

## CONDENSED STATE SUMMARY FOR 1938.

Month.	Temperature.				Precipitation, (average).						Number of days.

<sup>1</sup> Excluding chickens under 3 months old.

## UTILIZATION OF TOTAL MILK PRODUCED

105,958 MILLION POUNDS

MORE THAN HALF OF THE MILK PRODUCED IN THE UNITED STATES IS USED IN THE PRODUCTION OF BUTTER, CHEESE, AND OTHER MANUFACTURED DAIRY PRODUCTS. PRACTICALLY ALL THE REST IS USED FOR FLUID CONSUMPTION AS MILK OR CREAM, EXCEPT A SMALL QUANTITY FED ON FARMS. ABOUT ONE-FOURTH OF THE TOTAL SUPPLY IS USED ON THE FARMS WHERE IT IS PRODUCED

## WHOLE MILK EQUIVALENT OF FACTORY DAIRY PRODUCTS

47,032 MILLION POUNDS

CREAMERY BUTTER PRODUCTION ACCOUNTS FOR MORE THAN TWO-THIRDS OF ALL THE MILK USED FOR PRODUCING FACTORY DAIRY PRODUCTS. CHEESE, EVAPORATED AND CONDENSED MILK, AND ICE CREAM ACCOUNT FOR NEARLY ALL OF THE REMAINDER.

 Whole milk equivalent utilized in one dairy product which undergoes further processing in the production of a second dairy product:

- A. USED FOR CHEESE, WHEY FAT BEING RECOVERED AND GOING INTO CREAMERY BUTTER
- B. USED IN PLAIN OR SWEETENED CONDENSED MILK WHICH GOES INTO ICE CREAM
- C. USED IN CREAMERY BUTTER WHICH GOES INTO ICE CREAM

## FOREWORD.

---

Agriculture is continually faced with readjustment problems in its production and marketing programs in order to keep pace with the ever changing economic conditions. Reliable basic information is necessary if these changes are to be made most advantageously, and agriculture, like all other business, is demanding more and more that all facts bearing upon this great industry be made available as promptly as possible. The greatly expanded and practical use of county and state agricultural statistics in administering the national farm legislation and farm planning activities in Illinois is a recent example of the changing developments in the demand for and use of agricultural statistics.

The Illinois Cooperative Crop Reporting Service is attempting to meet these needs in the most economical manner possible through the publication of this annual summary, "Illinois Crop and Livestock Statistics," Circular 441. This publication is not designed as a discourse except for the immediate past; it is rather a compilation of historical and current material and graphic representation intended to answer concisely a wide variety of inquiries. The general plan and content is similar to that of previous issues with the data grouped into six main sections as follows: Section 1, state and county crop data for recent years; Section 2, livestock statistics; Section 3, dairy and poultry statistics; section 4, Illinois prices received by farmers; Section 5, miscellaneous Illinois statistics; Section 6, United States statistics.

Agricultural statistics have been compiled by the United States Department of Agriculture since 1866. The Illinois Cooperative Crop Reporting Service represents the Illinois Department of Agriculture and the United States Department of Agriculture through a cooperative agreement effected in August, 1925. The merging of the interests of these two departments into a single unit has made available much greater resources than could be commanded by each unit separately. The combined efforts and harmonious cooperation of the two departments have been largely responsible for the progress that has been made in recent years in Illinois agricultural statistics.

The regular publication of reliable agricultural statistics for Illinois as collected and distributed by the Illinois Cooperative Crop Reporting Service is dependent upon the voluntary cooperation of over 25,000 individual farmers and numerous commercial, educational, and governmental agencies in providing the basic data required. The Illinois and Federal Departments of Agriculture gratefully acknowledge the public-spirited cooperation which has made possible the issuance of this publication.

## SOIL TYPE DESCRIPTIONS.

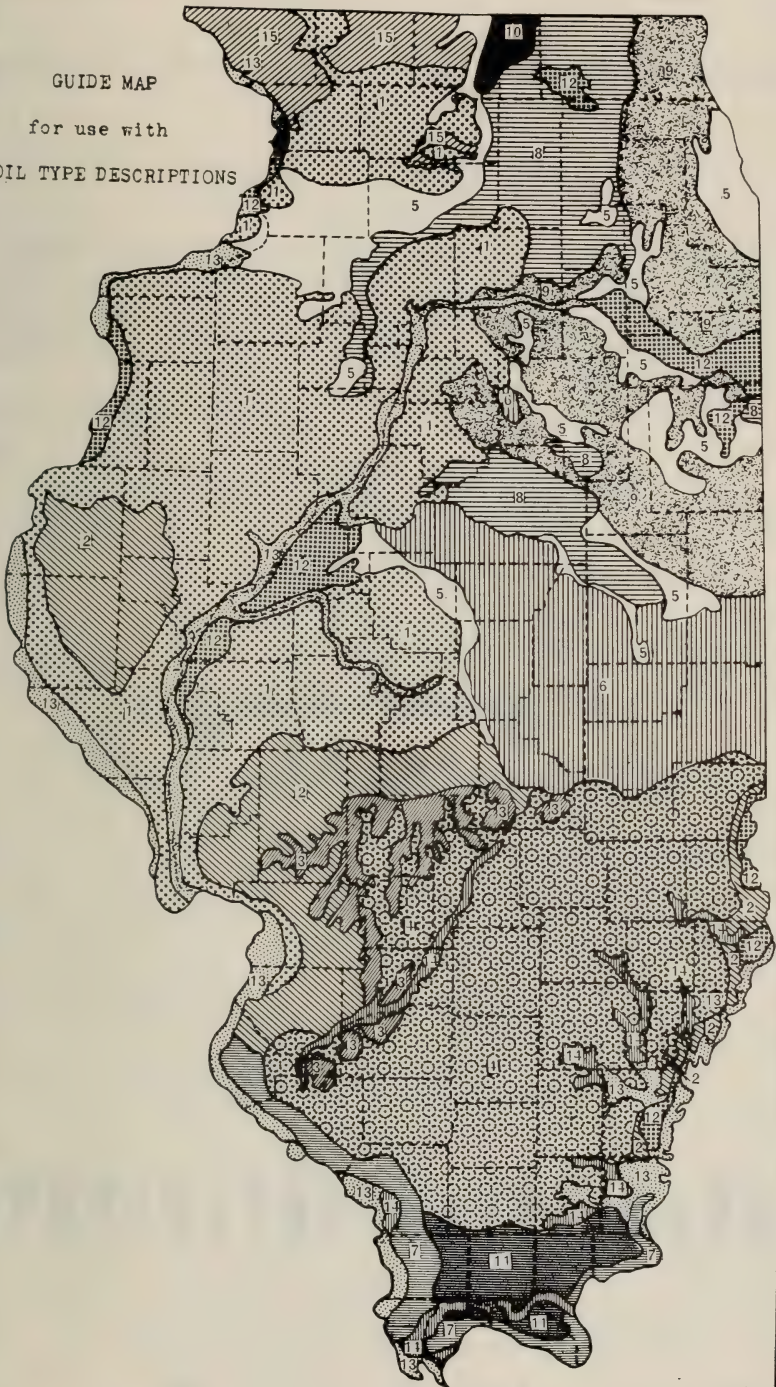

**For use with "Guide Map" shown on opposite page.**

---

1. Dark-colored and light-colored upland soils derived from deep loess.
2. Grayish brown prairie and timber soils with imperfectly developed claypan subsoils.
3. Brownish gray strongly leached prairie soils mostly with claypan subsoils.
4. Gray and yellowish gray strongly leached prairie and timber soils mostly with claypan subsoils.
5. Dark- and light-colored moderately leached soils developed on glacial outwash and old lake bed sediments.
6. Dark- and light-colored moderately leached soils developed from thin loess on permeable Wisconsin till.
7. Yellowish gray timber soils developed from deep loess with subsoils of medium permeability.
8. Dark- and light-colored soils, calcareous at 25 to 40 inches, developed from permeable Wisconsin till.
9. Dark- and light-colored moderately leached soils developed on slowly permeable Wisconsin till.
10. Dark- and light-colored moderately leached soils developed from very thin loess on moderately leached Illinoian till.
11. Soils of the Ozark uplift, largely undifferentiated.
12. Undifferentiated soils developed on glacial outwash plains and river terraces, frequently sandy and drouthy.
13. Undifferentiated dark-colored soils developed from stream sediments.
14. Undifferentiated light-colored soils developed from stream sediments.
15. Undifferentiated dark- and light-colored soils, rock outcrops frequent.

# SOURCE AND DISTRIBUTION OF AGRICULTURAL STATISTICS

UNITED STATES DEPARTMENT OF AGRICULTURE  
AGRICULTURAL MARKETING SERVICE  
DIVISION OF AGRICULTURAL STATISTICS

## PRINCIPAL SOURCES OF INFORMATION

## USE AND VALUE OF AGRICULTURAL STATISTICS.

---

Accurate crop acreage statistics are fundamental to reliable Illinois crop production statistics which are issued by the state and federal governments for the protection of the farmer. Agricultural statistics benefit all classes of people, especially producers, marketing and distributing agencies, because they relate to the essential facts of production and supply of food and raw materials and are unbiased, disinterested, and authoritative.

### Value of Agricultural Statistics:

#### (A) To Farmers:

##### *Directly—*

1. Indispensable for equitable administration of county and state farm programs for the benefit of the farmer by the state and federal governments.
2. Widely used by Federal Land Banks in administration of farm loan business in all counties.
3. Supplies an official agricultural business service.
4. Supplies the basic data for issuing agricultural outlook reports and part of data for all land utilization projects.
5. Guide to increasing or decreasing acreages of particular crops or livestock numbers.
6. Guide to marketing.

##### *Indirectly—*

1. Prevents issuance of biased, false, and misleading reports or minimizes their effect.
2. Reduces speculation the same as laws check but do not entirely prevent crime. Increased certainty of supply reduces wide price margins due to uncertainty.
3. Furnishes information permitting a better adjustment of prices in accordance with facts of supply and demand.

- (B) Cooperative Farmers Associations: Enables them to formulate constructive programs and policies, and market their products more advantageously.
- (C) Agricultural College and Extension Workers: Aids them in preparing crop and livestock production programs, also to measure the progress or success of their work.
- (D) Government, Financial Interests, and Insurance Organizations: Enables them to keep closely in touch with the needs of the agricultural industry.
- (E) Railroads: Enables them to estimate the number of cars that must be provided to facilitate the movement of agricultural products.
- (F) Manufacturers and Merchants: 1. Guide to locating supplies of agricultural products. 2. Guide to locating manufacturing plants.
- (G) Prospective Investors and Settlers: Guide to relative agricultural resources and advantages of the state.
- (H) Legislators: Furnishes authoritative state and county agricultural records for reference purposes and is an important basis for wise and constructive legislation with respect to agriculture.
- (I) National Government: In time of war.

# UTILIZATION OF HARVESTED ACREAGE (FIELD CROPS) ILLINOIS-1939

## TOTAL ACREAGE OF PRINCIPAL FIELD CROPS LEADING STATES-1939

## ANNUAL ILLINOIS CROP SUMMARY FOR 1939.

---

For the third successive year, 1939, production of Illinois crops was well above average. The total tonnage of grain crops, which was nearly 30 percent larger than the 10-year (1929-38) average, was produced on about 5 percent less than the 10-year average acreage. Prices received by growers held up reasonably well and the total value of the principal crops harvested in Illinois in 1939 was approximately 350 million dollars which is about 20 percent more than the 10-year average. Corn continued to account for more than half of the total value of all Illinois crops, and the value of the soybean crop ranked second, for the first time. Next in rank were all tame hay, winter wheat, and oats, respectively.

Corn yields which averaged 52 bushels per acre for the State were 4 bushels per acre larger than the previous record established in 1937, and soybean yields at 24.5 bushels were 1 bushel above the previous record set in 1938. Wheat yields averaged the second largest on record, and tame hay yields were the largest in 55 years. Oats, rye, and barley yields were near average, and fruit production was well above average.

The acreage of corn in 1939 was less than in any year since 1874, with the exception of 1934, but because of the record yield per acre, the total production has been exceeded only four times during the same period. Although the 1939 corn acreage was the smallest in years, this crop accounted for about 40 percent of the total crop acreage in Illinois. There were more than twice as many acres of corn as for any other crop. Both oats and tame hay accounted for about one-sixth of the total crop acreage while wheat and soybeans for beans accounted for about one-tenth each.

The record yield of corn in 1939 may be attributed partly to the large acreage of hybrid corn which has shown a phenomenal increase during the past three years. Only about 15 percent of the total corn acreage was planted with hybrid seed in 1937; this increased to 45 percent in 1938 and to 66 percent in 1939.

The soybean crop also broke many records. By far the largest acreage on record—more than 2½ million acres—was harvested either for hay or for beans in 1939. This is 171 times larger than the 15 thousand acres harvested in 1919 and 5 times larger than the 514 thousand acres harvested in 1929. Yields during 1939 for both hay and beans were the largest on record. Illinois produced more than half of the total U. S. crop of soybeans harvested for beans in 1939, and her production was more than three times that of any other state.

Quality of most crops in 1939 was well above average. Corn quality for the most part was excellent; however, there was some shrinkage due to forced maturity by the exceptionally hot, dry weather during September, and since the crop became so dry, there was more than usual shelling in handling at harvest time. Soybean quality was above average, but hot, dry weather in September forced a too-rapid maturing of soybeans which had grown quite rank during the wet weather in August. As the result, there were more green beans and more cracking of beans at harvest time than usual and in addition germination quality of the seed was injured. 1939 was an abundant hay year, with quality varying from below average due to frequent rains during the harvest of earlier hay crops to above average for later cuttings. Wheat, barley, and rye quality averaged only fair, while oats quality for the most part was poor.

## CHARACTER OF THE SEASON DURING 1939.

The 1939 season began with large grain and forage supplies on Illinois farms. Livestock was in good condition, farm work was well advanced, and fall grain condition was about average.

Temperatures during January, February, and the first half of March averaged above normal. January was the third warmest January in 50 years, averaging nearly 7 degrees above normal. There were no temperature extremes during February nor early March.

Total precipitation for the first two and one-half months of the year was above normal. The heaviest snow in 24 years fell over the northern two-thirds of Illinois on January 29th. February snowfall, however, was only about one-half of normal, but ample rainfall was well distributed over the State during the month. These soaking rains fell upon ground that was not frozen and did much to improve surface and subsoil moisture conditions. The resulting muddy fields and soft roads delayed farm work and hindered marketings during February and early March.

The last ten days of March were unseasonably warm and dry and farm work advanced very rapidly. Southern Illinois cherry, apricot, and plum trees were in full bloom by April 1st, and peach trees were starting to bloom. Cold weather the first few days of April and killing frosts April 12th-13th injured this fruit.

Rainfall continued above normal during April, and temperatures until the last week or ten days were below normal. This cool, wet weather retarded plant growth and delayed spring soil preparation and planting. Farm work was about two weeks behind schedule at the end of the month.

The last week of April turned off warm, followed by cool weather during the first week of May which was accompanied with the last killing frost of the season for northern Illinois on May 3rd. Temperatures during the rest of May averaged well above normal, but rainfall was considerably below normal. Crop growth was not retarded by the dry weather because of ample soil moisture resulting from the heavy April rains. Farm work advanced at a rapid rate, and by June first, corn planting was 96 percent completed and soybean planting 76 percent completed.

Temperatures during June and July averaged about normal. There were no marked extremes during these months, with only three days showing readings of 100 degrees or more. Rainfall was above normal during June and about normal during July. July rains were largely local in character. Because of this uneven distribution, dry spots developed in various parts of the State while many areas became too wet. There were practically no general rains during the month, but the frequent light showers delayed small grain harvest.

The first three weeks of August were very wet and cool and resulted in one of the wettest Augusts on record. The ample rainfall improved soil for fall plowing, renewed pastures, resulted in rank growth of soybeans and abundant weed growth, and aided the rapid spread of corn rots and molds.

The last week of August turned off hot and dry, and was the start of the longest fall drought on record. The hot weather continued through September which proved to be the fourth warmest September in fifty years. Temperature readings of 100 degrees or more were recorded at Springfield on seven different days during the month, and this was the second time in 50 years that 100-degree temperatures were recorded in September. It also was the driest September on record. This hot, dry weather checked further rank growth of soybeans, checked further development of corn rots and molds, and hastened corn and soybean maturity. Some new corn was grading No. 2 by October 1st. The abnormally rapid maturing of soybeans following the rank growth in September resulted in many green beans and much cracking of beans during harvest. The hot weather also damaged late apples by reducing keeping quality and was responsible for a heavy drop.

The dry weather continued for the balance of the year, producing the most severe autumn drought in the fifty years of record. Rainfall was less than half of normal during the four-month period, September through December. The drought continued unbroken for 37 days at Springfield, 36 days at Cairo, 35 days at Peoria, and 33 days at Chicago, and was broken then by only light rains.

The warm, dry weather was very favorable for late harvest operations but delayed fall plowing and seeding, and resulted in uneven germination of fall-sown grains. Corn husking was 65 percent completed and soybean harvesting 85 percent completed by November 1st and both operations were nearly completed by December 1st which are high records. All crops matured ahead of the first killing frosts which covered northern Illinois on October 1st and the entire State on October 14th and 15th.

At the close of the year, farm work was well advanced and livestock condition was very good. Although some farmers had been feeding hay to livestock since early October, farm stocks of hay, other roughage, and of grains were unusually large and sufficient as a rule to take care of the lengthened feeding period.

### FRUITS.

The 1939 season was favorable for large production of all kinds of fruit in Illinois. Production of peaches, pears, and grapes ranged from 32 to 36 percent above the ten-year (1929-38) average, while commercial apple production was 47 percent above the five-year (1934-38) average. Summer apples were a large crop, but considerable quantities were not harvested due to low prices. Insect and disease damage to early apples was much below average and size and quality of the fruit were above average. High temperatures and drought during September caused an unusually heavy drop of later varieties, especially of Jonathans and Grimes Golden, forcing growers to rush harvest operations in order to salvage as much of the crop as possible. Severe leaf roller and late worm damage resulted in a larger than usual proportion of the crop being marketed as commercial grade and in bulk.

The peach crop ranked with the best on record for size, quality, and color. Although early April frosts killed many blooms, particularly in the extreme southern areas, a heavy set necessitated extensive thinning.

The pear crop was uneven, with trees in the important commercial areas carrying a smaller crop than elsewhere in the State. September heat and drought caused a rather heavy drop.

Grape production was the largest on record and the quality of the crop was unusually good.

### TRUCK CROPS.

Taken as a whole, the 1939 production of truck crops in Illinois was less than in 1938 but was equal to or larger than the ten-year (1929-38) average. For most crops, yields were not equal to 1938 but were better than the ten-year average. Average prices were slightly lower than in 1938 and were considerably lower than the ten-year average, resulting in a total value for 1939 production 14 percent less than in 1938 and 12 percent less than average.

Wet, cool weather in the early spring delayed planting of early crops such as snap beans and spinach, retarded growth of asparagus, and delayed strawberries. Due to continued unfavorable weather during the asparagus season, cuttings were not large at any time, and the proportion of large, good-quality "grass" was considerably less than usual. Although strawberries were somewhat later than usual, quality was good and the largest crop on record was harvested. Crops that were seeded or transplanted in the late spring and early summer started off very well and for most of these crops, yields were above average. Early cabbage yields and quality were

above average but yields and quality for late cabbage were low. Cucumber quality was good and yields were much better than average. Cantaloupe yields were poor and quality was only fair since there were many discolored and poorly-netted melons. Watermelon yields and quality were better than average but the season did not last as long as usual. Although tomato yields were above average, quality was below average. The extended fall drought starting the last week of August, coupled with severe heat during the first half of September, reduced the acreage and yield of late crops such as snap beans and fall spinach and injured strawberry and asparagus beds.

1938.....	19,294,060					293,949,000	
1939.....	18,390,820					347,127,000	

<sup>1</sup> To secure total planted soybean acreage add 94,000 acres for 1936, 108,000 acres for 1937, 160,000 acres for 1938, and 163,000 for 1939. For cowpeas add 16,000 acres for 1936, 5,000 acres for 1937, 15,000 acres for 1938, and 30,000 for 1939 which were plowed under or pastured. Estimates of acreage plowed under and pastured are not available for previous years.

<sup>2</sup> Pounds.

<sup>3</sup> December 1st price.

<sup>4</sup> Per cwt.

<sup>5</sup> Production estimates include only the commercial apple counties in Illinois which are Adams, Pike, Greene, Macoupin, Calhoun, Jersey, Marion, Clay, Richland, Jefferson, Jackson, Will, Union, Johnson, Pope, Pulaski, and Massac. These data are not comparable with former "commercial estimates" which represented sales for fresh consumption only in the entire State. Price and value estimates are pending revision.

<sup>6</sup> Per thousand.

<sup>7</sup> The average value per acre of all crops, excluding fruits, listed in the above Illinois crop summary table is: 1930, \$13.63; 1931, \$8.84; 1932, \$9.10; 1933, \$11.38; 1934, \$14.39; 1935, \$16.68; 1936, \$19.74; 1937, \$18.63; 1938, \$15.11; 1939, \$18.74.

---

# GROSS FARM VALUE OF ILLINOIS LIVESTOCK JANUARY 1, 1940

## AGGREGATE VALUE OF LIVESTOCK CATTLE, HOGS, SHEEP, HORSES, AND MULES LEADING STATES - JANUARY 1, 1940

## JANUARY 1, 1940 LIVESTOCK REPORT FOR ILLINOIS.

---

The moderate annual expansion of cattle and hog numbers that started during 1935 was greatly accelerated during 1939 by the influence of abundant feed supplies accumulated from the large crops for three successive years. The total number of livestock on Illinois farms increased 14 per cent during 1939 and was 15 per cent larger than the ten-year (1930-39) average. This increase in numbers was due to large increases in hog and beef cattle numbers since milk cow and sheep numbers remained about the same, and horse and mule numbers declined. Although livestock numbers increased during the year, the aggregate value of all species on January 1, 1940 was 2 per cent less than a year earlier due mainly to sharp decreases in the price per head of hogs, horses, and mules.

### HORSES AND MULES.

The number of horses and mules on Illinois farms which has been steadily declining since 1913 was 5 per cent less on January 1, 1940 than a year earlier. The 721 thousand horses and mules (including colts) on farms January 1, 1940 was only 43 per cent of the number on farms in 1913. The rate of decrease in horse or mule numbers which ranged from 3 or 5 per cent a year during the period 1920 to 1931 leveled off to only 1 or 2 per cent a year until 1938 when the decrease again became 4 or 5 per cent a year. As the result of the decrease in horse and mule numbers coupled with a lower average price per head, the total value of horses and mules on January 1, 1940 was 15 per cent less than the year before and was 20 per cent less than the ten-year (1930-39) average.

### ALL CATTLE.

The number of all cattle on Illinois farms January 1, 1940 was 8 per cent larger than a year earlier and was the largest number since 1904. Beef type animals accounted for most of the increase since milk cow numbers registered only a 1 per cent gain during the year and were only slightly larger than the ten-year average. The number of yearling heifers being kept for milk cows, however, had increased 12 per cent during the year. An increase of nearly \$1.00 per head in the price of cattle coupled with the increased number resulted in a gain of 10 per cent during the year in the total value of all cattle.

### HOGS.

The total of 5,485,000 hogs of all ages on Illinois farms January 1, 1940 was 24 per cent larger than the year before and has been exceeded only three times in the 73 years of record. The large increase of over a million head during 1939 has been exceeded only once. In spite of the large increase in numbers, the total value of all hogs on January 1, 1940 was 13 per cent less than the year before. The 1939 spring pig crop was 14 per cent larger than in 1938 and was the largest since 1933. In spite of rather heavy losses during February and March 1939, 6.08 pigs were saved per litter which was less than a year earlier but was more than the ten-year average. The fall farrowing season was very favorable for saving pigs, with 6.32 pigs saved per litter which is the third largest in the fifteen years of record.

### SHEEP.

The increase shown in cattle and hog numbers was not reflected in sheep since the number on Illinois farms on January 1, 1940 was the same as a year earlier. The number of sheep and lambs on feed and the number of stock sheep were unchanged from a year earlier and had been exceeded only three times during the past twenty years. The average price per head on January 1, 1940 was only slightly more than a year earlier but was 12 per cent higher than the ten-year average.

### UTILIZATION OF WHOLE MILK PRODUCED ON ILLINOIS FARMS—1939

### GROSS FARM INCOME FROM DAIRY PRODUCTS LEADING STATES—1939

## ILLINOIS DAIRY STATISTICS.

Illinois is an important dairy State ranking sixth of all the states in gross income from milk production in 1939. During 1939 Illinois ranked sixth in average number of milk cows on farms, and since average milk production per cow was high, ranked fifth among the states in total milk produced. The average number of milk cows on Illinois farms during 1939 excluding heifers that had not freshened, was 1,080,000 and total milk produced on farms during the year is estimated at 5,227 million pounds. Data showing the production of milk and other dairy products, and farm value and utilization of milk produced on farms are shown in the following tables:

ILLINOIS MILK AND BUTTERFAT PRODUCTION AND VALUE—1929-1939.

<sup>1</sup> Figures are not estimates of production but merely averages calculated by dividing the reported daily milk production of herds on about the first day of each month by the number of cows milked and all milk cows, respectively, in herds kept by crop correspondents.

## ILLINOIS POULTRY STATISTICS.

Illinois ranked third in number of chickens on farms January 1, 1940. Thirty-five million or more chickens are usually raised and over one and one-half billion eggs produced annually in the State. The cash income from the sale of chickens and eggs during 1939 amounted to 6 per cent of all cash farm income. Income from the sale of eggs exceeds that from the sale of chickens each year. There are chickens on 95 per cent of all farms in Illinois.

ILLINOIS—NUMBER AND VALUE OF CHICKENS ON FARMS—JANUARY 1, 1924-1940.

# **Illinois Prices Received by Farmers**

---

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

ALL PRODUCTS

This chart shows the general movement of Illinois prices received by farmers as represented by the prices of twenty-one important products which account for approximately 94 percent of the cash income to Illinois farmers. The 100 percent line is the average of the prices of these products for the period 1910 to 1914, and the position of the index at any time shows the relation of Illinois prices received by farmers at that time compared with prices during the five years 1910 to 1914. The actual figures by months and years are given in the table on page 95.

## UNITED STATES INDEX OF PRICES RECEIVED BY FARMERS

ALL PRODUCTS

United States prices received by farmers have fluctuated since 1910 as shown in the above chart. The base period is taken for the five years ending in July, 1914, and the monthly prices are shown as a percent of this period. Because of the large number and wide distribution of products included, the index does not fluctuate as much as indices for smaller areas. The actual figures by months and years are given in the table on page 95.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS.

The index of prices received by Illinois farmers for their products from 1910 to the present time is shown on the opposite page. The general level of prices received by Illinois farmers was quite stable until 1916 when a strong rise started. By the middle of 1917 prices were approximately twice the pre-war, 1910-1914, level. This high level was maintained until the middle of 1920 when a precipitous decline commenced which brought prices of farm products down to the pre-war level late in 1921. An upward reaction soon raised Illinois prices received by farmers to a level of 15 to 20 percent above the pre-war mark where they remained until the summer of 1924. The index shows that prices from 1925 through 1929 fluctuated within rather narrow limits between 25 and 50 percent above the 1910-1914 average. Then followed the drastic decline which continued until prices were less than 50 percent of the pre-war period of stability. The sharp advance in prices of farm products which started in April, 1933 continued with some minor setbacks until August, 1937. Starting with the last four months of 1937 there was a sharp decline which lasted until February of the succeeding year at which time prices received by farmers became more stable and with the exception of June, July, and August, 1939 have fluctuated between 90 and 100 percent of the 1910-1914 average.

The general level of prices received by farmers in Illinois has been quite similar to the level of the United States prices received by farmers during most of the 1910-1940 period. There was some disparity in the period from 1922 to 1924 when the United States level was higher than that of Illinois. This difference was largely due to the effect of cotton prices.

The prices used in the preparation of the Illinois index of prices received by farmers are published on the following pages and are the prices obtained by the United States Department of Agriculture through the Illinois Cooperative Crop Reporting Service from reporters throughout the State. These are estimates of prices received by farmers.<sup>1</sup> The 1910-1914 average prices are taken as base prices since this is the most recent period of required length in which a reasonable degree of price equilibrium has existed. A base price for soybeans has been established by converting the 1930-1934 average soybean price on the basis of the relationship which existed between the 1930-1934 average price of other grains and their base price. Therefore, the index numbers show combined prices of farm products as a percent of the 1910-1914 average, which is referred to as the pre-war period. Many other farm price indices employ this same base period which makes them directly comparable with the one here published for Illinois.

Prices of twenty-one important and representative Illinois farm products are used in calculating the index. The average cash farm income from these twenty-one products amounts to approximately 94 percent of the total Illinois cash farm income. The index is described as one of weighted aggregates and is calculated in the same manner as the United States index of prices received by farmers.<sup>2</sup> The commodities are combined in the index so that each product with the exception of soybeans influences the index in proportion to its average importance as a source of cash income to Illinois farmers during the period 1924-1928.<sup>3</sup> The weight given soybeans is based on the average farm sales for the period 1930-1934 as this is considered the most representative period of soybean sales to date. The index accordingly measures the percentage relationship between the value of given quantities

<sup>1</sup> "Reliability and Adequacy of Farm Price Data," by C. F. Sarle, U. S. Department of Agriculture, Department Bulletin No. 1480.

<sup>2</sup> "Crops and Markets Supplement," U. S. Department of Agriculture, August, 1924, page 285.

<sup>3</sup> "Farm Value, Gross Income, and Cash Income from Farm Production, 1924 to 1928," A Preliminary Report, March, 1930, Part I—Sections 1 and 2, published by the Bureau of Agricultural Economics, U. S. Department of Agriculture.

of agricultural products at the prices prevailing at any given time and the value of the same quantities at prices in the base period, 1910-1914. The following Illinois products are used in the index. The quantities given are estimates of average annual amounts sold from Illinois farms during the five-year period, 1924-1928.<sup>1</sup>

Grains—		Meat Animals—	
Corn .....	130,453,000 bu.	Hogs .....	13,291,000 cwt.
Wheat .....	29,078,000 bu.	Cattle .....	9,114,000 cwt.
Oats .....	67,209,000 bu.	Calves .....	704,000 cwt.
Barley .....	4,737,000 bu.	Sheep .....	76,000 cwt.
Soybeans .....	4,914,000 bu.	Lambs .....	524,000 cwt.
Fruits—		Chickens and Eggs—	
Apples .....	5,299,000 bu.	Chickens .....	101,032,000 lbs.
Peaches .....	735,000 bu.	Eggs .....	105,783,000 doz.
Miscellaneous—		Dairy Products—	
Hay .....	803,000 tons	Milk .....	18,266,000 cwt.
Horses and Mules ..	25,000 head	Butterfat .....	43,907,000 lbs.
Wool .....	3,657,000 lbs.	Butter .....	5,680,000 lbs.
Potatoes .....	2,619,000 bu.		

The commodities of the index are separated into related groups as shown in the preceding table and separate indices are presented in tabular and chart form for these groups on the following pages. Meat animals are the principal group with hogs and cattle the major products. Grains have a large influence on the index with corn value amounting to over half of the group value. The index therefore closely follows a trend representing the average of these two important groups. The six commodity groups influence the index as follows:

Grains .....	34.4 percent
Fruits .....	1.6 percent
Meat Animals .....	40.8 percent
Chickens and Eggs .....	8.4 percent
Dairy Products .....	10.3 percent
Miscellaneous .....	4.5 percent
Total .....	100.0 percent

The charts on page 96 show Illinois and United States prices received by farmers stated in terms of their ratio to prices farmers in the entire country have to pay for commodities used by them in the household and in their program of production. The index of prices paid by farmers for the United States, which is shown in the chart on page 98, is constructed to measure changes in prices of goods bought for use in farm production and in the farm home, and to show the relation of the price levels at any given time to those which prevailed in the five-year period, 1910-1914. However, this index number series does not measure changes in farm expenditures but merely shows changes in the value of a fixed bill of goods from year to year and month to month. Hence, the index of prices received by farmers when divided by the index of prices paid by farmers, or the ratio of prices received to prices paid, does not measure the purchasing power of the farmer. It represents, however, the amount that a given quantity of selected farm products would purchase of a given quantity of goods farmers buy in relation to what they would purchase in the base period.

The ratio of prices received to prices paid fluctuated around 100 during the period 1910-1916. Then for about three years the prices of farm products were well above the prices of commodities purchased, which was a period of real prosperity for agriculture. With the drop in prices of farm products in 1920 this advantage was lost and the period from 1921 to 1924 was very unfavorable. From 1925 to 1930 the ratio was somewhat higher but farmers were required to spend about one dollar for ninety cents worth of products even during this period of general business and industrial prosperity. The decline in farm product prices from 1930 through 1932 was much more rapid than the decline in prices asked for farm supplies, and as a result the ratio of farm prices received to prices paid dropped to an extremely low level early in 1933. After that time the ratio generally improved until in August, 1936, it stood at 107. It fluctuated around that point through September, 1937, and then the ratio dropped rapidly to 84 in November, 1937. The ratio of prices received to prices paid has, with few exceptions, fluctuated between 75 and 80 since that time.

<sup>1</sup> Soybeans represent the average farm sales during 1930-1934.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

RATIO OF PRICES RECEIVED TO PRICES PAID

The index above provides a comparison of the prices received by Illinois farmers any given time and the prices they are being asked to pay for products needed for the household and in production. The index of prices paid by farmers is on an annual basis from 1910 to 1922 and on a monthly basis since February, 1923. When the index is above 100 per cent, then prices received are higher compared with the 1910 to 1914 average than are prices being paid. A ratio below 100 per cent indicates that prices received are comparatively lower than prices to be paid. For further discussion see page 93. The actual figures are given in the table on the opposite page.

## UNITED STATES INDEX OF PRICES RECEIVED BY FARMERS

RATIO OF PRICES RECEIVED TO PRICES PAID

The United States ratio of prices received to prices paid by farmers employs the same set of prices being paid by farmers as the above index for Illinois, but the prices received are those representing the entire United States as shown in the chart on page 92. The actual figures are given in the table on the opposite page.

<sup>1</sup> Based on United States index of prices paid by farmers.

## UNITED STATES INDEX OF PRICES PAID BY FARMERS

ALL ITEMS

The index number series of prices paid by farmers is constructed to measure changes in prices of goods bought for use in farm production and in the farm home, and to show the relation of these price levels to those which prevailed in the 5-year period 1910-1914. Local dealers in all parts of the United States report prices upon schedules furnished by the Division of Agricultural Statistics of the United States Department of Agriculture. The averages of prices for the United States are combined according to their relative importance as determined by average quantities of commodities purchased per farm or per farm family in the 6-year period 1924-1929.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

GRAINS

The Grain index shown in the above chart includes the prices of corn, wheat, oats, barley, and soybeans combined according to their importance as a source of cash income to Illinois farmers. Grain prices fluctuate considerably and at rapid rates. During the recent period of low prices this index reached a lower point than any other commodity group. However, from August, 1936 through July, 1937 this index was at a higher level than any other commodity group. It then dropped rapidly until in December it was one of the lowest of the commodity groups. The table below shows the monthly and annual figures of the grain index.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

MEAT ANIMALS

Prices for hogs, beef cattle, veal calves, sheep, and lambs are included in the above index. Hogs are the most important single source of income to Illinois farmers which income during the period 1924 to 1928 averaged nearly a hundred million dollars per year. This index has more influence on the all commodities index than any other commodity group.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

CHICKENS &amp; EGGS

The Chickens and Eggs index shows a large amount of seasonal variation with highest prices usually during the winter months. The prices of chickens and eggs have averaged higher during the period since the world war than most other products. Compared with other commodity groups, chickens and eggs were especially high during the 1921 to 1924 period.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

## DAIRY PRODUCTS

The dairy products index shown in the chart above shows a uniform seasonal variation, reflecting the seasonal variation in dairy production. This index includes the prices of milk, butterfat, and butter since 1921, while previous to 1921 butterfat was converted into butter equivalent, and butter price used to represent dairy products other than milk. Similar to chickens and eggs, dairy products have been maintained at a higher price level since 1921 than the grain and live-stock groups.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

FRUIT

The Illinois index of fruit prices is represented by the prices of apples and peaches. The above index shows a rather regular annual change or seasonal variation because of the seasonal conditions of production and semi-perishable nature of fruits.

## 1939 WEATHER SUMMARY FOR ILLINOIS.

E. W. HOLCOMB, *State Meteorologist.*

UNITED STATES WEATHER BUREAU.

Springfield, Illinois.

### GENERAL SUMMARY.

The year 1939 was outstanding for the record autumn drought, the unusually warm months of January, September and December—third, fourth and sixth warmest respectively in the past 50 years—and for one of the warmer Mays and one of the wetter Augusts of record. Monthly temperatures averaged above normal except in April, August and November. The winter months were comparatively mild (January averaging  $6.6^{\circ}$  above normal), and zero temperatures were of infrequent occurrence. The summer was characterized by moderate temperatures, June averaging slightly above normal, July and August comparatively cool. Maxima of  $100^{\circ}$  or higher occurred on three days in July and seven days in September; it was only the second time in the last 50 years that  $100^{\circ}$  readings have been recorded in the latter month. The last killing frost of spring occurred about May 3d in the north portion of the State, and about April 12-13th in the central and south portions. The first killing frost of autumn occurred over part of the north and central portions on October 1st, in the remainder of those divisions on October 14th, and over the south portion generally on October 14-15th.

Sunshine was somewhat to considerably above the normal generally in March, May, September, October and December, and deficient in February, April and over most of the State in November.

Although precipitation averaged only 0.80 inch below normal for the year as a whole, there occurred the most severe autumn drought of record, exceeding in intensity all previous September to November periods in the past half century. Precipitation was above normal in all but one of the first eight months, May rainfall being sub-normal. Annual distribution varied from more than 10 inches below normal in areas of the extreme north to lesser deficiencies over much of the north, west-central and southeast; above normal amounts occurred from east-central counties southwestward over the south-central and the extreme southwest. Positive departures of more than an inch occurred in February, April, June and August, the last mentioned being one of the wettest Augusts in the past 50 years. In contrast September was the driest for that month, and September to November precipitation the least of record since 1890. The drought which had its inception in late August persisted through December, and the four months—September to December inclusive—were the driest for a similar period in the fifty years of record, averaging but 49% of normal, compared with 119% of normal for the first eight months of the year. Snowfall averaged above normal for the three winter months and the January total was the fourth heaviest in the past 26 years.

Damage from wind, hail and lightning during the year was about average. There were three tornadoes in June and one in August, with combined property and crop losses of approximately \$175,000 and injury to 12 persons.

Weather conditions in the early months of the year were generally favorable for winter wheat and other winter crops. In April, however, shower frequency and rather cold weather retarded field work and crop growth to some extent. Conditions improved materially in May as a result of a change to warmer together with a generally high percentage of effective sunshine. Oats, however, continued to suffer from a poor start, caused by late planting and unfavorable early season moisture conditions. Corn planting proceeded actively during May and was nearly completed at the close of the month. Generally favorable growing weather prevailed throughout the summer and promoted rapid progress of most crops. Corn and soy beans were generally an excellent crop, the former one of the best on record. The extreme dryness in the closing four months of the year resulted in considerable deterioration of pastures, though alfalfa and clover continued in

mostly fair to good condition. Fall seeding of winter wheat proceeded under great difficulty in many localities on account of surface and sub-soil dryness, and while some replenishment of moisture occurred in November and December, the crop as a whole ranged in condition from rather poor to good with 10% rated poor. Sub-soil moisture was very deficient at the year's close and there were increased reports of well-water shortage in localities.—C.L.R.

<sup>1</sup> Standard bushel used in the United States contains 2,150.42 cubic inches; the gallon, 231 cubic inches, the cranberry barrel, 5,826 cubic inches, and the standard fruit and vegetable barrel, 7,056 cubic inches. Such large-sized products as apples and potatoes sometimes are sold on the basis of a heaped bushel, which would exceed somewhat the 2,150.42 cubic inches of a bushel basket level full. This also applies to such products as sweet potatoes, peaches, green beans, green peas, spinach, etc.

<sup>2</sup> Approximate inside dimensions, 10 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 18 inches.

<sup>3</sup> Approximate inside dimensions, 4 $\frac{1}{2}$  by 16 by 16 $\frac{1}{2}$  inches.

<sup>4</sup> Approximate inside dimensions, 9 $\frac{1}{2}$  by 11 by 20 $\frac{1}{2}$  inches.

<sup>5</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>6</sup> Approximate inside dimensions, 4 $\frac{3}{16}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>7</sup> Approximate inside dimensions, 13 by 18 by 21 $\frac{1}{2}$  inches.

<sup>8</sup> Approximate inside dimensions, 12 by 12 by 22 $\frac{1}{2}$  inches.

<sup>9</sup> This is the weight commonly used in trade practice, the actual weight varying according to temperature conditions.

<sup>10</sup> Approximate inside dimensions, 22 by 16 by 20 $\frac{1}{2}$  inches.

<sup>11</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 14 $\frac{1}{2}$  inches.

<sup>12</sup> The standard weight of 70 pounds is usually recognized as being about 2 measured bushels of corn, husked, on the ear, because it required 70 pounds to yield 1 bushel, or 56 pounds of shelled corn.

<sup>13</sup> For statistical purposes the bale of cotton is 500 pounds gross or 478 pounds net weight. Actual bale weights vary considerably, and the customary average weights of bales of foreign cotton differ from that of the American square bale.

<sup>14</sup> This is the average weight of cottonseed, although the legal weight in some States varies from this figure of 32 pounds.

<sup>15</sup> Approximate inside dimensions, 9 $\frac{1}{2}$  by 10 $\frac{1}{2}$  by 15 inches.

<sup>16</sup> Approximate inside dimensions, 1 $\frac{1}{2}$  by 11 by 16 $\frac{1}{2}$  inches.

<sup>17</sup> Approximate inside dimensions, 12 by 12 by 24 inches.

<sup>18</sup> Approximate inside dimensions, 11 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 24 inches.

<sup>19</sup> Approximate inside dimensions, 5 $\frac{1}{2}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>20</sup> Approximate inside dimensions, 4 $\frac{1}{2}$  by 16 by 16 $\frac{1}{2}$  inches.

<sup>21</sup> About 13 pounds of sawdust are required to pack 32 pounds of grapes in a keg, thus making the total weight about 45 pounds.

<sup>22</sup> Approximate inside dimensions, 7 $\frac{1}{2}$  by 15 by 18 $\frac{1}{2}$  inches.

<sup>23</sup> Approximate inside dimensions, 10 by 13 by 25 inches.

<sup>24</sup> Approximate inside dimensions, 8 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 18 inches.

<sup>25</sup> Approximate inside dimensions, 12 by 10 $\frac{1}{2}$  by 33 inches.

<sup>26</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 11 by 18 inches.

<sup>27</sup> This average of 55 pounds indicates the usual weight of sweetpotatoes when harvested. Much weight is lost in curing or drying, and the net weight when sold in terminal markets may be far below 55 pounds.

<sup>28</sup> Approximate inside dimensions, 6 by 12 by 24 inches.

<sup>1</sup> Preliminary estimates. States grouped mainly on a basis of production practices and yields. In computing averages, data were weighted by acreage harvested.

<sup>2</sup> Includes threshing for wheat and oats.

<sup>3</sup> Includes charges for water for irrigation, twine and sacks, crop insurance, use of implements, use of storage buildings, overhead, including a small amount of miscellaneous labor, and a charge for expenses incurred on acreage abandoned because of crop failure.

<sup>4</sup> Includes a charge for rent on the acreage not harvested because of crop failure.

<sup>5</sup> Estimated costs in 1938 if yields and acre abandonment had been the average of 1928-37. The average United States yield per acre harvested in that period was for corn 23.7 bushels, for wheat 13.4 bushels, and for oats 28.0 bushels.

<sup>6</sup> Includes the 6 New England States, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, Kentucky, and Tennessee.

<sup>7</sup> Includes the States of North Carolina, South Carolina, Georgia, Florida, Alabama, and Mississippi.

<sup>8</sup> Includes the States of Arkansas, Louisiana, Oklahoma, and Texas.

<sup>9</sup> Includes the States of Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and California.

<sup>10</sup> Includes the 6 New England States, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia, and Kentucky.

<sup>11</sup> Includes the States of North Carolina, South Carolina, Georgia, Tennessee, Alabama, and Arkansas.

<sup>12</sup> Includes the States of Idaho, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and California.

<sup>1</sup> Pounds.<sup>2</sup> Estimates of the commercial crop refer to the production of apples in the commercial apple counties of each State and are not comparable with former "Commercial" estimates which represented sales for fresh consumption only in the entire State.<sup>3</sup> Includes some quantities not harvested on account of market conditions. Values are based on the quantities actually harvested plus the quantities of fruit that were sold but left on the trees in 1930, 1931 and 1933. Quantities not harvested: 1930—10,639,000 bushels, including 6,180,000 bushels sold but left on trees; 1931—8,063,000 bushels, including 3,938,000 bushels sold but left on trees; 1932—6,793,000 bushels; 1933—3,571,000 bushels, including 1,404,000 bushels sold but left on trees; 1934—2,208,000 bushels.<sup>4</sup> Includes some quantities not harvested on account of market conditions. Prices and values are computed on the harvested crop. Quantities not harvested: 1930—1,292,000 bushels; 1931—625,000 bushels; 1932—3,616,000 bushels; 1933—2,447,000 bushels; 1934—375,000 bushels.

<sup>1</sup> For Texas and California the weight per fleece is the amount of wool shorn per sheep and lambs shorn during the year.

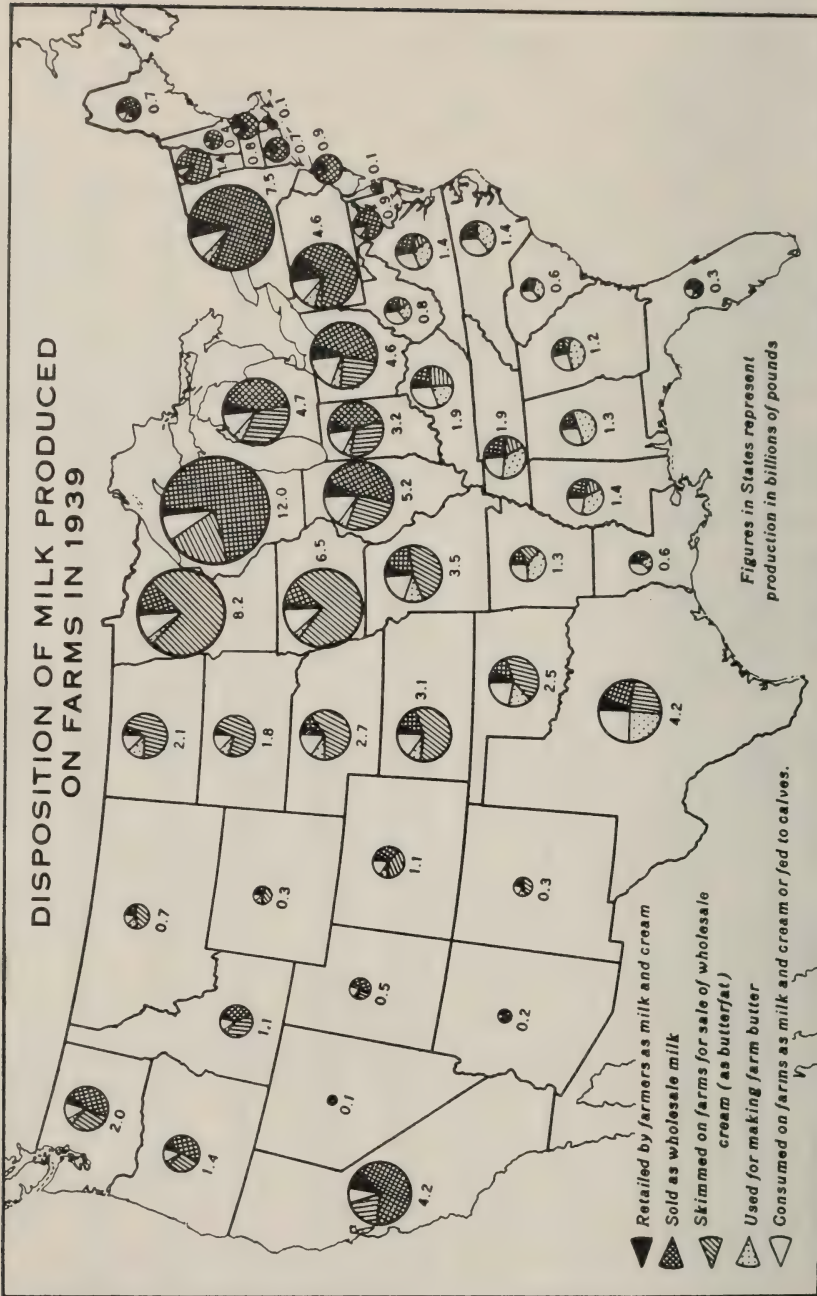

<sup>2</sup> Includes sheep shorn at commercial feeding yards.

## FOREWORD.

---

Agriculture is continually faced with readjustment problems in its production and marketing programs in order to keep pace with the ever changing economic conditions. Reliable basic information is necessary if these changes are to be made most advantageously, and agriculture, like all other business, is demanding more and more that all facts bearing upon this great industry be made available as promptly as possible. The greatly expanded and practical use of county and state agricultural statistics in administering the national farm legislation and farm planning activities and the increased need of reliable agricultural data in national defense are recent examples of the changing developments in the demand for and use of agricultural statistics.

The Illinois Cooperative Crop Reporting Service is attempting to meet these needs in the most economical manner possible through the publication of this annual summary, "Illinois Crop and Livestock Statistics," Circular 442. This publication is not designed as a discourse except for the immediate past; it is rather a compilation of historical and current material and graphic representation intended to answer concisely a wide variety of inquiries. The general plan and content is similar to that of previous issues except that county estimates are not included in this publication.<sup>1</sup> As in past years, the data are grouped into six main sections as follows: Section 1, Illinois crop statistics for recent years; Section 2, livestock statistics; Section 3, dairy and poultry statistics; Section 4, Illinois prices received by farmers; Section 5, miscellaneous Illinois statistics; Section 6, United States statistics.

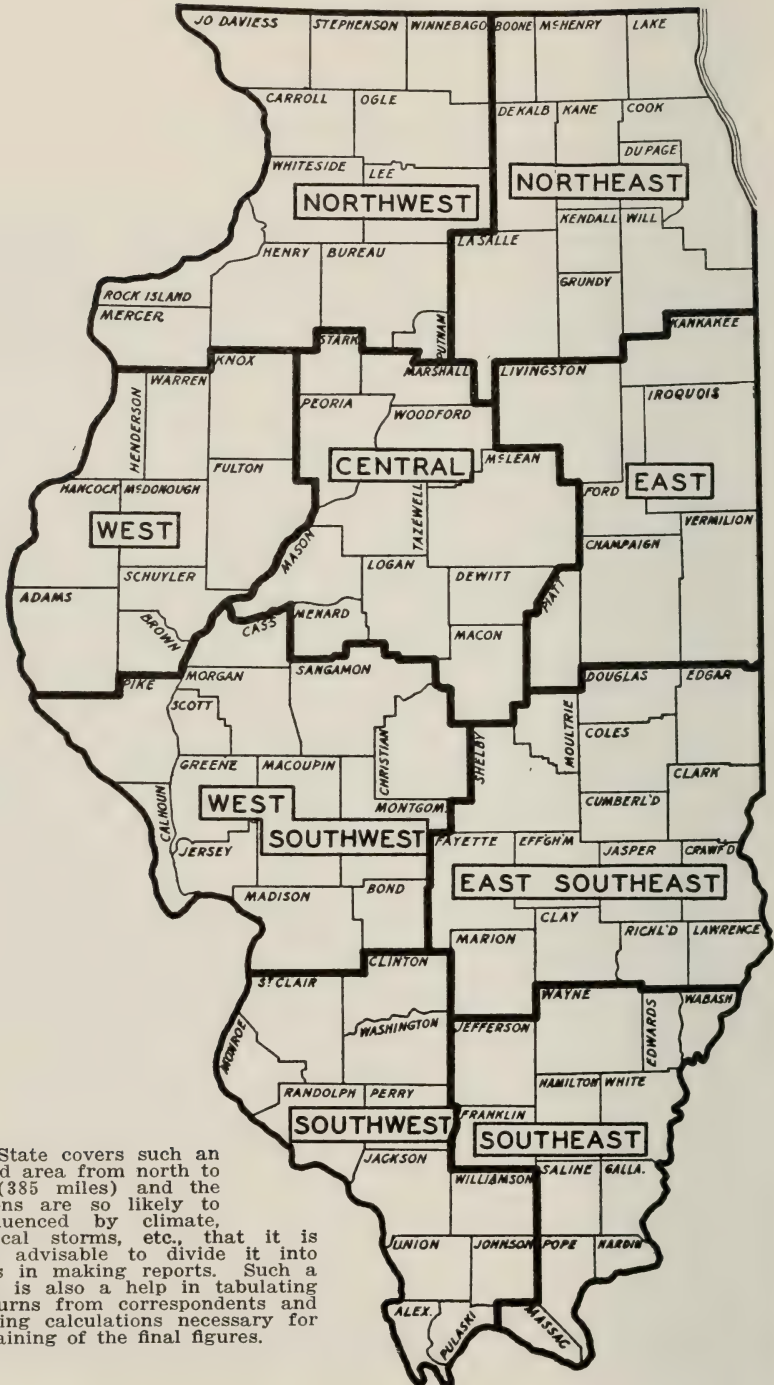

Agricultural statistics have been compiled by the United States Department of Agriculture since 1866. The Illinois Cooperative Crop Reporting Service represents the Illinois Department of Agriculture and the United States Department of Agriculture through a cooperative agreement effected in August, 1925. The merging of the interests of these two departments into a single unit has made available much greater resources than could be commanded by each unit separately. The combined efforts and harmonious cooperation of the two departments have been largely responsible for the progress that has been made in recent years in Illinois agricultural statistics.

The regular publication of reliable agricultural statistics for Illinois as collected and distributed by the Illinois Cooperative Crop Reporting Service is dependent upon the voluntary cooperation of over 25,000 individual farmers and numerous commercial, educational, and governmental agencies in providing the basic data required. The Illinois and Federal Departments of Agriculture gratefully acknowledge the public-spirited cooperation which has made possible the issuance of this publication.

---

<sup>1</sup> County estimates for 1939 and 1940 are published in a mimeographed pamphlet which is available upon request. Present plans are to issue a large printed publication about October, 1942 which will include county crop and livestock estimates from 1935 through 1941.

# OUTLINE MAP OF ILLINOIS.

The State covers such an extended area from north to south (385 miles) and the conditions are so likely to be influenced by climate, soil, local storms, etc., that it is deemed advisable to divide it into districts in making reports. Such a division is also a help in tabulating the returns from correspondents and in making calculations necessary for the obtaining of the final figures.

# UTILIZATION OF HARVESTED ACREAGE (FIELD CROPS) ILLINOIS-1940

## TOTAL ACREAGE OF PRINCIPAL FIELD CROPS LEADING STATES-1940

## ANNUAL ILLINOIS CROP SUMMARY FOR 1940.

---

The aggregate farm value of the principal crops produced in Illinois in 1940 was \$354,721,000 or practically the same as the 1939 value of \$354,914,000. Corn led all other crops in value, accounting for \$205,991,000 or 58 percent of the total. Oats ranked second with \$45,749,000, tame hay third with \$32,960,000, wheat fourth with \$28,108,000, and soybeans for beans fifth at \$24,598,000. In 1939 soybeans were second in farm value. Illinois, the leading soybean State, produced 44 percent of the nation's crop in 1940 and two and one-third times more than Iowa which ranks second. The total acreage of crops harvested at 18,481,470 was little changed from 18,487,820 acres in 1939 though 3 percent less than the 1930-39 average of 19,052,825 acres. Increases over 1939 in the acreages of tame hay, soybeans, cowpeas, oats, sorghums, broomcorn, and potatoes were offset by decreased acreages of corn, wheat, and other crops. Total soybean acreage made a new high record and tame hay acreage was the largest since 1924.

The 1940 aggregate production of corn for grain, wheat, oats, barley, and rye was 9 percent less than in 1939 but 13 percent more than the 1929-38 average. Hay and forage production (including silage and sorghums) was 6 percent above 1939 and 17 percent above average. Soybean and cowpea grain production was one-fourth less than in 1939 but more than double the 1929-38 average. The tonnage of tree fruits was not quite half as large as the 1939 production.

Illinois corn production at 332,244,000 bushels was 20 percent less than the 1939 crop. The 1940 corn yield was below the previous three years but was above any yield prior to 1937 because of the increased acreage of hybrid corn, use of better land for corn, and the increased use of power machinery. Oats and barley yields per acre were the highest on record. Winter wheat yield was exceeded only in 1931 and spring wheat yield was the best since 1918. Early hay crops were very good but later cuttings were hurt by drought. Production on the record acreage of soybeans for beans was 25 percent less than the record 1939 crop due to the lower yield, caused mainly by adverse weather, weeds, and below-average quality of seed. Production of red and alsike seed was the largest on record. Lespedeza seed production was 57 percent below that of 1939. Broomcorn production was 17 percent larger than in 1939 and of excellent quality. Apple and peach crops were small. A late winter freeze caused a failure in peaches except in the Massac-Pulaski-southern Union County area. Apple production in the 17 commercial counties was less than half of the 1939 production and about a third less than the 1934-38 average. The pear and grape crops were larger than average.

1940 was marked by much dry and cool weather and the most acute shortage of stock water on farms in years, especially over central and southern Illinois. April, August, November, and December were the only months since August, 1939 that had normal or near-normal rainfall. Northern and upper west central Illinois were the more favored rainfall areas. Rainfall deficiency was the most severe in the upper east central and south-eastern counties, resulting in materially reduced yields of corn and soybeans. April rains coupled with rather cool weather to mid-July resulted in most spring-planted crops being later than usual but were very favorable for both yields and quality of small grain crops. Excessive heat and dry weather from July 21 to August 6 came too late to damage small grains. Except in the northern counties small grains were secured in good condition. Killing frosts were general over central and northern Illinois September 26 and 27,

but the bulk of the corn and soybean crops was too far advanced to be damaged. Corn and soybeans were slow in drying, resulting in a later harvest than in the past few years.

### CHARACTER OF THE SEASON.

Illinois started the 1940 season with the third coldest month in its 51 years of climatological history and one of the more severe ever experienced in this State. Below-normal temperatures occurred on 25 days of the month and sub-zero temperatures were reported on 11 days for the northern and 9 days for the southern part of the State. Injury to winter crops by the cold was lessened considerably by a protective covering of snow which fell during December and the first week of January but the persistent low temperatures did considerable damage to fruit trees in certain sections and were responsible in part for the shortening of the peach crop. Precipitation was below normal during January for the fifth consecutive month and the September, 1939-January, 1940 period was the driest of any similar period on Illinois records.

Temperatures during February averaged about 16 degrees warmer than for the preceding month. Precipitation ranged from about 60 percent of normal in northern and central Illinois to 130 percent of normal in the southern section, but the average for the State again fell below normal, and the deficiency in subsoil moisture continued to accumulate. Condition of winter crops continued from fair to good except in a few localities in the east central and southeast sections where inadequate snow protection and the deficit in moisture showed some effect. Slightly less than normal rainfall during March brought the accumulated deficiency in precipitation since the preceding September up to 8.04 inches below normal. Low temperatures retarded plant growth and wet surface soil checked field work during the first two weeks of the month, but mild weather during the latter half was favorable for advancing farm work.

Unusually cool weather prevailed throughout both April and May. Rather bountiful rains during the former month replenished surface soil moisture. Rainfall while not up to normal was sufficient to maintain the generally good condition of crops and resulted in favorable soil conditions for good seedbed preparation. Near to and below freezing temperatures occurred on May 4th but did little damage because most crops had such a late start.

Cool nights and warm days made June, 1940 an exceptionally favorable month for growth and maturing of small grain crops. Warm, dry days favored rapid growth and timely care of corn and soybeans, and, as a result, most fields of these crops were exceptionally free from grass and weeds. The shortage of rainfall was evidenced in the rather short pastures but did not decrease the early hay yields to any appreciable extent. This cool weather extended into the first part of July, but starting on July 19 temperatures rose considerably and from that time they were frequently 10 degrees or more above normal. Rainfall for the State averaged only about half of the normal amount but the dry weather was excellent for maturing and harvesting small grains. The quality and yields of these crops were among the highest on Illinois records. The corn crop held up very well in spite of the lack of rain until the last week of July, but then insufficient moisture and the unusual heat caused it to fire badly, especially in several upper central and east central counties and over much of southeastern Illinois.

Relief from the July heat wave came about August 6 after which date scattered showers followed by a few good rains brought the total precipitation for the month in the northern and central sections to above normal. Although these rains were too late to be of much help to corn, they were of considerable aid to pastures and the later crops. Respite from dry weather was rather short, however. Pastures which had started to recover during August were parched during September which was one of the driest on Illinois records. Stock water shortage was the most extensive in years and failing pastures necessitated an early start with supplemental feeds. The month though unfavorable in many respects was excellent for harvesting of hay and cloverseed.

October, 1940 was the sixth warmest October in 51 years of Illinois records. This mild weather was excellent for farm work and coupled with above-normal precipitation kept fall crops in fair to good condition in spite of the accumulated deficiency in moisture. The first ten days of November continued mild but on November 11th and 12th a cold snap of record suddenness and intensity occurred during which time temperatures fell as much as 40 degrees in a few hours. This excessive drop in temperature accompanied by high winds injured apple trees in border counties from Adams south to Calhoun, damaged winter wheat in west central Illinois, injured strawberry beds, and resulted in noticeable loss of life and property. This cold wave was of short duration, however, and after a few days temperatures returned to normal. December averaged the warmest for any December since 1931 and farm work progressed rapidly. Although snowfall averaged less than in any December in the last 28 years, the total precipitation averaged about normal. This and the favorable moisture situation during November relieved the acute shortage of water somewhat and improved surface moisture conditions. The year ended with abundant supplies of feed on farms, with livestock in good condition and with farm work well advanced.

### FRUITS.

The 1940 season was unfavorable for most fruit crops in Illinois. Commercial apple production was less than half of the 1939 production, and with the exception of the extreme southern counties peaches were a failure. Production of pears and grapes, however, while less than in 1939, was above the ten-year average. Late spring frosts and wet, cold weather during the pollination period resulted in a poor set of apples. The summer apple crop—Transparents and Duchess—was about a third of a crop. Drought conditions and hot weather during August and September in the commercial apple regions accompanied by the most severe leaf roller and codling moth damage on record were contributing factors to the short production of fall and winter apples. For the most part, apple quality was poor with a smaller percentage than usual grading No. 1 and a much larger proportion than usual being sold as commercial grade or in bulk and with comparatively small quantities going into storage. The short crop coupled with fairly good demand for off-grade apples resulted in only small quantities not being harvested.

Because of low winter temperatures, peaches were a failure except in Pulaski and Massac Counties and in southern Union County. Total production was only 14 percent of the 1939 production and 18 percent of the ten-year (1930-39) average. Quality was good, but prices did not hold up as well as would be anticipated from the extremely short crop.

Production of pears in 1940 was 5 percent less than in 1939 but was 15 percent more than the ten-year (1930-39) average. Prolonged dry weather during the growing season and the prevalence of blight interfered with sizing and there was a tendency towards roughness.

Although production of grapes in 1940 was 8 percent less than in 1939, it was the third largest production on record. Insect and disease damage throughout the season was less than usual and a high-quality fruit was produced.

### TRUCK CROPS.

The 1940 total acreage of truck crops in Illinois for market (excluding market garden areas surrounding the larger cities) and for manufacture was 16 percent larger than in 1939 but was 12 percent smaller than the ten-year (1929-38) average. For the most part 1940 yields average lower and prices higher than during 1939. The total value of sales of truck crops for market (excluding market garden areas surrounding the larger cities) and truck crops for manufacture was estimated at \$4,352,000 for 1940, which is 13 percent more than in 1939 but is 2 percent less than the ten-year average.

Wet, cool weather in the spring of 1940 retarded planting of most truck crops and resulted in a late start which was not overcome all season. Early plantings of snap beans were seriously injured by heavy beating rains and considerable replanting was necessary. Asparagus cutting started about a

week to ten days later than usual and due to continued cool weather, cuttings were light the first half of the season. Warm weather resulted in heavier cuttings during the last half of the season and yields for the season were nearly up to 1939. Quality was average or better all season. Strawberry harvest also started late. Quality was not so good at first but improved as the season advanced. Although yields for the season were less than in 1939, the increased acreage resulted in the largest production of strawberries on record. In spite of the large crop, prices held up very well.

Cabbage harvest started later than usual, with yields and quality better than usual. As the season advanced, insects did considerable damage and quality became poor. Tomatoes in Union County had a poor start due to cool, wet weather, and cut worm injury necessitated considerable replanting. The crop was late but favorable weather during the harvesting season resulted in good-quality tomatoes. Northern Illinois tomatoes were also late starting and were injured by hot, dry weather during July. Cool weather and above-normal rainfall during August resulted in the plants going largely to vines and as a result, tomatoes were small, poor in quality, and there was much bursting and rotting in the fields. Watermelons and cantaloupes were delayed by wet, cool weather in the spring and by hot, dry weather later in the season, and quality was not as good as usual.

<sup>1</sup> To secure total planted soybean acreage add 94,000 acres for 1936, 108,000 for 1937, 160,000 for 1938, 249,000 for 1939 and 276,000 for 1940. For cowpeas add 16,000 acres for 1936, 5,000 for 1937, 15,000 acres for 1938, 16,000 acres for 1939 and 40,000 acres for 1940, which were plowed under or pastured. Estimates of acreage plowed under and pastured are not available for previous years.

<sup>2</sup> Pounds.

<sup>3</sup> December 1st price.

<sup>4</sup> Per cwt.

<sup>5</sup> Production estimates include only the commercial apple counties in Illinois which are Adams, Pike, Greene, Macoupin, Calhoun, Jersey, Marion, Clay, Richland, Jefferson, Jackson, Williamson, Union, Johnson, Pope, Pulaski and Massac. These data are not comparable with former "Commercial estimates" which represented sales for fresh consumption only in the entire State. Price and value estimates prior to 1939 are pending revision.

<sup>6</sup> Per thousand.

<sup>7</sup> The average value per acre of all crops, excluding fruits, listed in the above Illinois crop summary table is: 1930, \$13.63; 1931, \$8.84; 1932, \$9.10; 1933, \$11.38; 1934, \$14.39; 1935, \$16.68; 1936, \$19.74; 1937, \$18.63; 1938, \$15.11; 1939, \$18.89; 1940, \$19.04.

# **Illinois Livestock Statistics**

---

# GROSS FARM VALUE OF ILLINOIS LIVESTOCK JANUARY 1, 1941

## AGGREGATE VALUE OF LIVESTOCK CATTLE, HOGS, SHEEP, HORSES, AND MULES LEADING STATES — JANUARY 1, 1941

## ANNUAL LIVESTOCK INVENTORY—JANUARY 1, 1941.

Livestock on Illinois farms had an inventory value of \$255,217,000 on January 1, 1941, an increase of 1 percent over a year earlier, despite a decrease of 5 percent in total number. The value per head increased \$3.70 for cattle, 90 cents for sheep, and 40 cents for hogs, and decreased \$12.00 for horses and \$16.00 for mules in comparison with a year earlier. The sharpest change in livestock numbers occurred in hogs, where there was a decrease from 5,750,000 January 1, 1940 to 5,175,000 on January 1, 1941. This drop of 10 percent resulted from a decrease in the 1940 pig crop and unusually heavy marketings prior to January 1, 1941. Horse numbers declined 7 percent and mules 2 percent. There are now just slightly more than a third as many horses and mules on Illinois farms as there were in the record high year of 1913. Sheep numbers showed no change. The number of all cattle increased 5 percent to 3,061,000 head January 1, 1941. This total has been exceeded only two times in the past 74 years. Most of the increase was in beef cattle since the increase in milk cow numbers was but 2 percent.

### HORSES AND MULES.

The number of horses and mules on Illinois farms which has been steadily declining since 1913 was 6 percent less on January 1, 1941 than a year earlier. The 659,000 horses and mules (including colts) on farms January 1, 1941 was only 39 percent of the number on farms in 1913. The rate of decrease in horse and mule numbers which ranged from 3 to 5 percent a year during the period 1920 to 1931 leveled off at only 1 or 2 percent a year until 1938 when the decrease again became 4 to 6 percent a year. This decrease in numbers reflects the steady displacement of horses and mules by mechanical equipment.

### ALL CATTLE.

The number of all cattle on Illinois farms January 1, 1941 at 3,061,000 head was 5 percent larger than a year earlier and was the largest number since 1904. Beef type animals accounted for most of the increase since milk cow numbers registered only a 2 percent gain during the year. Although the increase was not so significant, the number of milk cows on Illinois farms January 1, 1941 has been exceeded only 3 times (January 1, 1934, 1935, and 1936) since records began in 1867.

Due to the larger number of cattle and an increased value per head, the total value of all cattle January 1, 1941, was 13 percent larger than a year earlier and this value has been exceeded only three times (January 1, 1918, 1919, and 1920) since records began.

### HOGS.

The sharpest change in livestock numbers occurred in hogs with a decrease of 10 percent from January 1, 1940 to January 1, 1941. This drop in numbers was due to a decrease in the 1940 pig crop and unusually heavy marketings prior to January 1, 1941. The 5,175,000 head on hand January 1, 1941, however, was 16 percent more than the ten-year (1930-39) average. The 1940 total pig crop was 3 percent less than in 1939 but was 20 percent more than the ten-year (1929-38) average. The number of pigs saved per litter in the spring of 1940 was below average, but due to a favorable fall farrowing season the average number of fall pigs saved per litter was the largest on record.

### SHEEP.

The total number of sheep and lambs on farms January 1, 1941 at 947,000 head was practically the same as a year earlier, with the 2 percent increase in stock sheep numbers being offset by a 5 percent decrease in the number of sheep and lambs on feed. The number of stock sheep on farms was 5 percent above the ten-year (1930-39) average and with the exception of 1936, the largest number since 1911.

### DISPOSITION OF WHOLE MILK PRODUCED ON ILLINOIS FARMS—1940

### GROSS FARM INCOME FROM DAIRY PRODUCTS LEADING STATES—1940

## ILLINOIS DAIRY STATISTICS.

The upward trend in milk and butterfat production per cow, in the proportion of milk sold at wholesale, and in the manufacture of dairy products that has been in evidence in Illinois during recent years continued in 1940. Milk and butterfat production per cow, total milk and butterfat production for the State, and whole milk sales in 1940 were the largest since 1924, the first year of record. On the other hand, farm-churned butter (both for sale and for home consumption) and retail sales of milk and cream by farmers in 1940 were new low records. With the exception of 1929 and 1930, total milk used on farms during 1940 was less than any other year of record.

In 1940 Illinois ranked fifth of all States (for the first time since 1936) in gross income to farmers from milk and dairy products. During 1940 Illinois ranked sixth in average number of milk cows on farms and, since production per cow was high, ranked fifth in total milk and butterfat produced. The average number of milk cows on Illinois farms during 1940, excluding heifers that had not freshened, was 1,095,000, the largest number since 1936, and total milk produced on farms during the year was 5,355,000,000 pounds, a new record.

An outstanding feature of the dairy manufacturing industry has been the rapid expansion in manufacture of cheese. Total cheese production (excluding cottage, pot, and bakers') has grown from 8,606,000 pounds in 1931 to a record high of 41,950,000 pounds in 1938. Production in 1939 was reported 3 percent less than in 1938 but larger than any year previous. American cheese made from whole milk has followed the same trend as total cheese. In 1938 Illinois became the second largest producer of American whole milk cheese and continued in that place in 1939 with an output of 29,207,000 pounds, 72 percent of the total cheese made in Illinois. Swiss cheese production reached the 5 million pound mark in 1939 for the first time. Creamery butter production in 1939 at 78,043,000 pounds reached a new high and compares with the 5-year (1932-36) average of 69,893,000 pounds. Ice cream production in 1939 reached 20,128,000 gallons compared to 18,688,000 in 1938 and 10,612,000 gallons in 1933.

<sup>1</sup> Computed from the value of milk, cream and farm butter sold divided by the quantity of milk or butterfat used in the preparation of these products for market.<sup>2</sup> Computed as difference between cash income and gross income from dairy products.<sup>3</sup> Milk utilized for products sold and for products consumed in the farm household valued at average returns for milk utilized in products sold. Prices shown are those currently used for computing values. In some instances these have been since revised, but no income revisions will be made until 1940 Census data are available.<sup>4</sup> Preliminary.

## ILLINOIS DISPOSITION OF MILK PRODUCED ON FARMS.

Year.	Milk fed or consumed on farms where produced.				Milk sold or utilized in preparation of dairy products sold from farms.				
	Fed to calves.	Consumed in the farm household.		Total used on farms.	In farm churned butter sold.	In wholesale deliveries to plants, dealers, etc.		In retail sales of milk and cream by farmers. <sup>1</sup>	Total utilized in products sold.
		As milk or cream.	As farm butter.			As Cream	As Milk

<sup>1</sup> Figures are not estimates of production but merely averages calculated by dividing the reported daily milk production of herds on about the first day of each month by the number of cows milked and all milk cows, respectively, in herds kept by crop correspondents.

**ILLINOIS MILK PRODUCTION PER COW  
ON FIRST OF EACH MONTH<sup>1</sup>**

## ILLINOIS POULTRY STATISTICS.

Poultry and eggs in Illinois during 1940 represented a \$45,858,000 industry. That sum represents the value of production from eggs, chickens, and turkeys. Production of 1,924,000,000 eggs in 1940 accounted for \$25,333,000 of this total. The 32,797,000 chickens produced were valued at \$19,022,000 and the estimated 648,000 turkeys raised in 1940 added \$1,503,000 to the total. The decreased production of chickens and eggs during 1940 was enough to offset both the increased production of turkeys and the increased price of eggs, and thereby resulted in a 2 percent decrease in the total value of production from 1939.

The importance of the poultry industry as a source of farm income is emphasized by the fact that about 215,120 farms, or 93 percent of the 231,312 farms in Illinois, produce chickens and eggs. Farm consumption of chickens and eggs is large and in Illinois usually amounts to about 25 percent of the eggs laid and about 27 percent of the chickens raised. Compared with all other States, Illinois ranked second in chicken production and sixth in egg production during 1940.

The pronounced expansion in the number of turkeys raised in Illinois during the past ten years brought numbers in 1940 to 648,000, more than six times larger than the number raised during 1930. Commercial hatching of poults has increased rapidly in recent years and has replaced much of the farm hatching. An increasing proportion of the turkeys is coming from the large flock producers. There are now many flocks in Illinois ranging from 1500 to 2500 birds, and several ranging from 10,000 to 20,000.

# **Illinois Prices Received by Farmers**

---

---

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

ALL PRODUCTS

This chart shows the general movement of Illinois prices received by farmers as represented by the prices of twenty-one important products which account for approximately 94 percent of the cash income to Illinois farmers. The 100 percent line is the average of the prices of these products for the period 1910 to 1914, and the position of the index at any time shows the relation of Illinois prices received by farmers at that time compared with prices during the five years 1910 to 1914. The actual figures by months and years for 1931-1941 are given in the table on page 54.

## UNITED STATES INDEX OF PRICES RECEIVED BY FARMERS

ALL PRODUCTS

United States prices received by farmers have fluctuated since 1910 as shown in the above chart. The base period is taken for the five years ending in July, 1914, and the monthly prices are shown as a percent of this period. Because of the large number and wide distribution of products included, the index does not fluctuate as much as indices for smaller areas. The actual figures by months and years for 1931-1941 are given in the table on page 54.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS.<sup>1</sup>

Increased specialization in agricultural production has brought about additional interest in the exchange value of farm products produced because it is through exchange that the individual farmer is able to obtain those items or commodities which he does not produce but which are essential if he is to live and continue production from year to year. Since the recognized medium of exchange is money, the amount of that medium that can be obtained in exchange for each unit of product produced has become of prime importance to the farmer as well as to the manufacturer, factory worker, etc. Thus, the current money value, commonly called price, is of deepest concern to farmers and the trend of prices from day to day, month to month, and year to year is viewed with a great deal of interest.

As shown by the chart on the opposite page, the general level of prices received by Illinois farmers was quite stable from 1910 through 1916 at which time a sharp rise started. This rapid increase, usually conceded to have been caused by conditions arising out of the First World War, lasted until October 1917, at which time the general level of prices received reached 210 percent of the pre-war (1910-1914) average. From then until September 1920 the index was fairly stable. The drop in prices which occurred following this latter date continued until June 1921 at which time the index stood at 108 percent of the 1910-1914 level. For the succeeding ten years, average prices received by Illinois farmers ranged, with considerable fluctuation, between 101 and 154. A decline starting in August 1929 marked the beginning of the most prolonged price drop since the start of the Illinois index. The bottom was reached in February and March 1933 and immediately an upswing started which lasted, with considerable fluctuation and a few setbacks, until April 1937. Following July 1937 another drop was experienced which reached a low of 81 in August 1939. An 18-point increase the next month brought the general level up to 99 and it fluctuated between that figure and 91 until September 1940 at which time the present upward trend began. The level of 114 percent of the 1910-1914 average reached in April 1941 was the highest since October 1937.

The general trend in prices received by farmers for the United States as a whole has been very much the same as that followed in Illinois except for the period extending from 1922 through 1924 during which the former was somewhat higher due largely to the strengthening effect of cotton prices.

As mentioned previously, money is merely a medium of exchange which provides a convenient means of converting products produced into commodities desired either now or in the future. Because of this function of exchange, considerable interest is evidenced concerning the ratio between the money received for products (prices received) and the amount necessary to purchase the desired commodities (prices paid). Charts showing the ratio of both Illinois and United States prices received to prices paid by farmers throughout the entire country for commodities purchased appear on page 55. From 1910-1916 the ratio fluctuated around 100 and for the next three years it was above the 1910-1914 average. These latter years were exceptionally favorable for farmers. With the drop in prices of farm products in 1920, this advantage was lost and the period from 1921 to 1924 was very unfavorable. From 1925 to 1930 the ratio was somewhat higher but farmers were required to spend about one dollar for every 90 cents worth of commodities purchased even during this period of general business and industrial prosperity. In the general decline following 1930, prices received for farm products fell much more rapidly than did the prices of commodities purchased by farmers and as a result the ratio dropped to an extremely low level in 1933. Following this low point the ratio gradually improved until, in August 1936, it stood at 107. It fluctuated around this point until September 1937 after which it dropped sharply, reaching 84 in November 1937. From then until July 1940 no definite trend was noticeable. Following that date the ratio improved somewhat, reaching 92 in April 1941.

<sup>1</sup>For a detailed description of the methods used in constructing this Index see pages 93 and 94 of Circular No. 441, Illinois Crop and Livestock Statistics.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

RATIO OF PRICES RECEIVED TO PRICES PAID

The index above provides a comparison of prices received by Illinois farmers at any given time and prices paid by farmers throughout the country as a whole for commodities needed in the household and in production. The index of prices paid by farmers is on an annual basis from 1910 to 1922 and on a monthly basis since February, 1923. When the index is above 100 per cent, then prices received are higher compared with the 1910 to 1914 average than are prices being paid. A ratio below 100 per cent indicates that prices received are comparatively lower than prices to be paid. For further discussion see page 53. The actual figures are given in the table on page 54.

## UNITED STATES INDEX OF PRICES RECEIVED BY FARMERS

RATIO OF PRICES RECEIVED TO PRICES PAID

The United States ratio of prices received to prices paid by farmers employs the same set of prices being paid by farmers as the above index for Illinois, but the prices received are those representing the entire United States as shown in the chart on page 52. The actual figures are given in the table on page 54.

1940	125

The index number series of prices paid by farmers is constructed to measure changes in prices of goods bought for use in farm production and in the farm home, and to show the relation of these price levels to those which prevailed in the 5-year period 1910-1914. Local dealers in all parts of the United States report prices upon schedules furnished by the Agricultural Statistics Division of the United States Department of Agriculture. The averages of prices for the United States are combined according to their relative importance as determined by average quantities of commodities purchased per farm or per farm family in the 6-year period 1924-1929.

## PRICES PAID BY FARMERS—1910-1914=100.

[illegible]

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

GRAINS

The Grain index shown in the above chart includes the prices of corn, wheat, oats, barley, and soybeans combined according to their importance as a source of cash income to Illinois farmers. Grain prices fluctuate considerably and at rapid rates. During the recent period of low prices this index reached a lower point than any other commodity group. However, from August 1936 through July, 1937 this index was at a higher level than any other commodity group. It then dropped rapidly until in December it was one of the lowest of the commodity groups. The table on page 58 shows the monthly and annual figures of the grain index.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

MEAT ANIMALS

Prices for hogs, beef cattle, veal calves, sheep, and lambs are included in the above index. Hogs are the most important single source of income to Illinois farmers which income during the period 1924 to 1928 averaged nearly a hundred million dollars per year. This index has more influence on the all commodities index than any other commodity group. The actual figures for this index appear on page 58.

ILLINOIS PRICES RECEIVED BY FARMERS.  
MEAT ANIMALS INDEX—1910-1914=100.

ILLINOIS PRICES RECEIVED BY FARMERS.  
CHICKENS AND EGGS INDEX—1910-1914=100.

ILLINOIS PRICES RECEIVED BY FARMERS.  
DAIRY PRODUCTS INDEX—1910-1914=100.

[illegible]

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

## CHICKENS &amp; EGGS

The Chickens and Eggs index shows a large amount of seasonal variation with highest prices usually during the winter months. The prices of chickens and eggs have averaged higher during the period since the world war than most other products. Compared with other commodity groups, chickens and eggs were especially high during the 1921 to 1924 period. See page 58 for the actual numbers.

## ILLINOIS INDEX OF PRICES RECEIVED BY FARMERS

## DAIRY PRODUCTS

The dairy products index shown in the chart above shows a uniform seasonal variation, reflecting the seasonal variation in dairy production. This index includes the prices of milk, butterfat, and butter since 1921, while previous to 1921 butterfat was converted into butter equivalent, and butter price used to represent dairy products other than milk. Similar to chickens and eggs, dairy products have been maintained at a higher price level since 1921 than the grain and livestock groups. Figures upon which this chart is based appear on page 58.

<sup>1</sup> The weighted average is obtained by weighting the mid-month prices by monthly marketings.

<sup>2</sup> Preliminary.

<sup>3</sup> For the period 1930-1936 the average is based on December through April prices. Beginning 1937 the weighted average is obtained by multiplying mid-month prices by monthly sales.

## 1940 WEATHER SUMMARY FOR ILLINOIS.

E. W. HOLCOMB, *State Meteorologist.*  
UNITED STATES WEATHER BUREAU.  
Springfield, Illinois.

### GENERAL SUMMARY.

This was the fourth driest year in the 51 years of State-wide records. This year's average exceeded the dry year of 1901 by 2.53 inches, that of 1914 by 0.30 inch, and that of 1930 by 1.03 inches. The dryness that characterized 1940 began with the closing days of August 1939. Comparing the 16-months' period ending with December 31, 1940, with the same period ending with the three previously mentioned especially dry years, it is found that the current 16-months' period is 0.50 inch less than any of the other three periods. Precipitation exceeded normal only in April, August, and November, and in those months by relatively small amounts. Deficiencies in March and July exceeded an inch, and in September amounted to three inches. Precipitation for the central division averaged slightly less than for the northern division, whereas, normally, it exceeds the northern division by more than three inches. Snowfall for the year was 1.7 inches less than normal. January snowfall averaged the tenth heaviest for that month, and February averaged slightly above normal. During the remaining winter months snowfall was decidedly sub-normal. An outstanding result of the prolonged precipitation deficiency was dry wells and failure otherwise of water sources in numerous localities, necessitating hauling of water considerable distances in some instances.

The year began with the coldest January of the 51 years of record; March, April, May, September, and November also averaged cold, particularly March and May. Contrastingly, February, June to August, October, and December averaged above normal, October and December being unusually warm. Temperature of zero at Sycamore on March 23 was the first record of zero in March since 1934. October was the sixth warmest of record for that particular month, and December the warmest since 1931. Extremes of temperature were the highest and lowest, respectively, since 1936. During January there were three periods of State-wide zero temperatures, stations in the southern division recording during that month zero or lower on 5 to 11 days, in the central division on 9 to 17 days, and in the northern division on 7 to 20 days. The persistence of low temperatures was considerable of a parallel to the exceptionally cold Januarys of 1912 and 1918 and the January 22-February 23d period of 1936. From about the 19th of July and extending to about August 5, maxima generally rose to above 90° daily, and many stations in all parts of the State from about the 24th on recorded temperatures above 100°, some on five or six successive days. Over 60 deaths from heat prostration were reported over the State during this period.

Last killing frost of spring generally occurred on April 14 in the south and extreme west-central portions of the State, and mostly on May 4 elsewhere. First killing frost in autumn came on November 7, except in the extreme north-central and extreme northwest, where it occurred on October 16. Generally, this made a growing season of approximately 187 to 207 days.

Sunshine was much below normal in February, and there was more cloudiness than normal in November and December. On the other hand, September and October were characterized by more than usual frequency of clear days.

Damage from hail, lightning, and windstorms, including tornadoes during the year amounted to approximately \$2,773,000. Total known deaths from all of these causes was 12, and injured about 100. A tornado passed over a portion of Alton, Madison County, during the afternoon of March 2. There were no fatalities in connection with this storm, but property damage amounted to approximately \$150,000, involving the unroofing of 12 residences and damage to approximately 750 other buildings. Other tornadoes occurred on April 29 and 30. The first affected a belt 50 to 75 yards wide through portions of Mason, Logan, and Tazewell Counties. There were no serious injuries, and

property damage was limited to approximately \$60,000, as the path of damage was confined entirely to rural sections. This storm apparently lifted and again made surface contact in Livingston County over a path about 10 miles long where one person was killed and 20 injured, but property damage was limited to about \$25,000. Two tornadoes on the 30th caused destruction of property to the extent of about \$200,000 and injuries to a number of persons in Alexander, Pulaski, Johnson, and Pope Counties.

While precipitation was deficient throughout nearly all of the crop season, and subsoil moisture deficiency developed into acuteness in many areas, favorable temperature conditions during critical periods and timely precipitation brought the small grain crop through in generally fine shape. The corn crop suffered severely in some southeastern areas, in west-central localities, and on some of the poorer soils, but in the main, a good crop was produced; this good showing in the face of quite persistent precipitation deficiency can be largely attributed to extensive use of hybrid corn and favorable temperature conditions during the greater part of the season. Soybeans, pastures, and late hay crops suffered severely from the continuing drouth, particularly as a result of acute dryness in September. General fall plowing was considerably delayed in numerous areas because of dryness of soil.

## CONDENSED STATE SUMMARY FOR 1940.

Month.	Temperature.				Precipitation (average).						Number of days

## SEEDING DATA FOR COMMON FIELD CROPS.

Crop.	Rate of seeding per acre		Time of seeding.		Depth.	Time of harvest.
	Drilled.	Rows.	Fall.	Spring.		
Alfalfa.....	12-15 lbs.	lbs.	Aug. 1-15.....	Apr.-May.....	Harrow in	June 10-July 20-August 30.
Barley.....	2 bu.		Mar. 15-Apr. 1.....		1-3 in.	July.
Bent grass.....	25 lbs.				1-1 in.	When in full bloom.
Bermuda grass.....	5 lbs.		Aug. 1-15.....	Late Spring.....	1-1 in.	When in full bloom.
Blue grass—						
Canada.....	25 lbs.		Aug. 15-Sept. 1.....	Mar.-May.....	1-1 in.	June.
Kentucky.....	25 lbs.		Aug. 15-Sept. 1.....	Mar.-May.....	1-1 in.	June 15.
Rough-stalked meadow.....	20-25 lbs.		Aug. 15-Sept. 1.....	Mar.-May.....	1-1 in.	June.
Brome grass.....	20 lbs.		Aug. 15-Sept. 1.....	Mar. 24-May 15.....	1-1 in.	September 15.
Broomcorn.....		2-3		May 5-20.....	2 in.	August.
Buckwheat.....	3-4 pecks			June 10-July 10.....	1-2 in.	September.
Canada field pea.....	14-3 bu.			Mar. 20-Apr. 10.....	1-3 in.	June-July.
Clover—						
Alsike.....	7-8 lbs.		July-Sept.....	Feb. 20-Apr. 10.....	1-1 in.	June, July.
Crimson.....	15-20 lbs.		Aug. 15-Sept. 15.....		1 in.	April, May.
Hop.....	6-8 lbs.		Aug. 15-Sept. 15.....		1 in.	June.
Mammoth.....	8-10 lbs.		Aug. 1-Sept. 1.....	Feb. 15-Mar. 15.....	1-1 in.	June 20-July 10.
Red.....	8-10 lbs.		Aug. 1-Sept. 1.....	Feb., Apr.....	1-1 in.	June 20.
White.....	6-8 lbs.		Aug. 1-Sept. 1.....	Apr., June.....	1-1 in.	June 20.
Corn.....	6-10			May 1-30.....	2 in.	November.
Cowpeas.....	90-120 lbs.	30-60		Apr.-May.....	1-2 in.	July-September.
Crested wheat grass.....	12-20 lbs.			Mar. 15-May 15.....	1-1 in.	June-July.
Dalea (Wood's clover).....	12-15 lbs.			Apr.....	1-1 in.	August-September.
Fescues—						
Chewing's.....	15-20 lbs.		Aug. 1-Sept. 1.....	Mar. 1-June 1.....	1-1 in.	June-July.
Meadow.....	25-35 lbs.		Aug. 1-Sept. 1.....	Apr.-May.....	1-1 in.	June-July.
Red.....	15-20 lbs.		Aug. 1-Sept. 1.....	Mar. 1-June 1.....	1-1 in.	June-July.
Sheep.....	28 lbs.		Aug. 1-Sept. 1.....	Apr. 1-15.....	1-1 in.	June-July.
Flax.....	30-40 lbs.			Apr. 1-15.....	1-1 in.	July.
Hemp.....	3 pecks		Aug. 1-Sept. 1.....	Apr. 15-May 1.....	1-1 in.	August.
Johnson grass.....	20-30 lbs.			Apr.-June.....	1-1 in.	When in full bloom.
Lespedeza—						
Korean.....	10-20 lbs.			Mar.-Apr.....	1 in.	September.
Sericea.....	15-30 lbs.			Feb., Apr.....	1 in.	When in full bloom.
Millet.....	30 lbs.			May 10-20.....	1 in.	July.
Oats.....	2 bu.			Mar. 20-Apr. 10.....	1 in.	July.
Oatgrass, tall.....	30 lbs.		Aug. 15.....	Mar., Apr.....	1-1 in.	When in full bloom.
Orchard grass.....	20 lbs.		Aug. 1-Sept. 1.....	Mar. 1-June 1.....	1-1 in.	Before full bloom.
Peanuts.....	32-48 lbs.			May 10-June 1.....	1-2 in.	September.
Rape.....	3-5 lbs.			Apr. 1-Aug. 15.....	1-1 in.	October-November.

## SEEDING DATA FOR COMMON FIELD CROPS—Concluded.

Crop.	Rate of seed per acre		Time of seeding.		Depth.	Time of harvest.
	Drilled.	Rows.	Fall.	Spring.		
Redtop.....	15-20 lbs.	lbs.	July 15-Sept. 10.	Mar. 1-June 1.	$\frac{1}{2}$ in.	When in full bloom.
Reed canary grass.....	20-25 lbs.	-----	Aug. 1-Sept. 1.	Mar. 1-Apr. 15.	$\frac{1}{4}$ -1 in.	When in full bloom.
Rye—						
Spring.....	60-90 lbs.	-----	-----	Mar.-May.	$\frac{1}{2}$ -2 in.	July.
Winter.....	60-75 lbs.	-----	Sept., Nov.	-----	$\frac{1}{2}$ -2 in.	July.
Rye grass.....	25-30 lbs.	-----	-----	Apr.-May.	$\frac{1}{4}$ - $\frac{1}{2}$ in.	When in full bloom.
Sorghum—						
Grain.....	60 lbs.	6-8	-----	May, June.	$\frac{1}{4}$ -1 in.	September.
Sweet.....	60-80 lbs.	6-8	-----	May, June.	$\frac{1}{4}$ -1 in.	September.
Soybeans.....	90-130 lbs.	50-70	-----	May 10-20.	$\frac{1}{2}$ -2 in.	September.
Sudan grass.....	20 lbs.	3-5	-----	May 10-20.	$\frac{1}{4}$ -1 in.	When in full bloom.
Sugar beets.....	-----	18-20	-----	Apr. 1-May 1.	-----	-----
Sunflower.....	8-10 lbs.	3-6	-----	May 10-20.	1 in.	August, September.
Sweet clover—						
Bien. white.....	12-15 lbs.	-----	Aug. 1-15.	Apr.-May.	$\frac{1}{4}$ -1 in.	August, October.
Bien. yellow.....	12-15 lbs.	-----	Aug. 1-15.	Apr.-May.	$\frac{1}{4}$ -1 in.	August, October.
Hulled.....	12-15 lbs.	-----	-----	Mar. 1-15.	$\frac{1}{4}$ -1 in.	August, October.
Unhulled.....	30 lbs.	-----	Aug. 15-Oct. 1.	Feb. 15-Mar. 1.	$\frac{1}{4}$ -1 in.	August, October.
Timothy.....	12-15 lbs.	-----	-----	Mar.-Apr.	$\frac{1}{4}$ -1 in.	June, July.
Wheat—						
Spring.....	2 bu.	-----	-----	Mar. 1-10.	1-3 in.	July.
Winter.....	6 pecks	-----	Sept. 20-Oct. 10.	-----	1-3 in.	July.
Yellow vetch.....	40 lbs.	-----	Sept. 10-Oct. 10.	Mar. 20-Apr. 10.	$\frac{1}{2}$ -2 in.	July.
Yellow trefoil.....	15 lbs.	-----	Aug. 15-Sept. 15.	-----	$\frac{1}{2}$ in.	May, June.

<sup>1</sup> Standard bushel used in the United States contains 2,150.42 cubic inches; the gallon, 231 cubic inches, the cranberry barrel, 5,826 cubic inches, and the standard fruit and vegetable barrel, 7,056 cubic inches. Such large-sized products as apples and potatoes sometimes are sold on the basis of a heaped bushel, which would exceed somewhat the 2,150.42 cubic inches of a bushel basket level full. This also applies to such products as sweet potatoes, peaches, green beans, green peas, spinach, etc.

<sup>2</sup> Approximate inside dimensions, 10 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 18 inches.

<sup>3</sup> Approximate inside dimensions, 4 $\frac{1}{2}$  by 16 by 16 $\frac{1}{2}$  inches.

<sup>4</sup> Approximate inside dimensions, 9 $\frac{1}{2}$  by 11 by 20 $\frac{1}{2}$  inches.

<sup>5</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>6</sup> Approximate inside dimensions, 4 $\frac{3}{16}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>7</sup> Approximate inside dimensions, 13 by 18 by 21 $\frac{1}{2}$  inches.

<sup>8</sup> Approximate inside dimensions, 12 by 12 by 22 $\frac{1}{2}$  inches.

<sup>9</sup> This is the weight commonly used in trade practice, the actual weight varying according to temperature conditions.

<sup>10</sup> Approximate inside dimensions, 22 by 16 by 20 $\frac{1}{2}$  inches.

<sup>11</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 14 $\frac{1}{2}$  inches.

<sup>12</sup> The standard weight of 70 pounds is usually recognized as being about 2 measured bushels of corn, husked, on the ear, because it required 70 pounds to yield 1 bushel, or 56 pounds of shelled corn.

<sup>13</sup> For statistical purposes the bale of cotton is 500 pounds gross or 478 pounds net weight. Actual bale weights vary considerably, and the customary average weights of bales of foreign cotton differ from that of the American square bale.

<sup>14</sup> This is the average weight of cottonseed, although the legal weight in some States varies from this figure of 32 pounds.

<sup>15</sup> Approximate inside dimensions, 9 $\frac{1}{2}$  by 10 $\frac{1}{2}$  by 15 inches.

<sup>16</sup> Approximate inside dimensions, 1 $\frac{1}{2}$  by 11 by 16 $\frac{1}{2}$  inches.

<sup>17</sup> Approximate inside dimensions, 12 by 12 by 24 inches.

<sup>18</sup> Approximate inside dimensions, 11 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 24 inches.

<sup>19</sup> Approximate inside dimensions, 5 $\frac{1}{2}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>20</sup> Approximate inside dimensions, 4 $\frac{1}{2}$  by 16 by 16 $\frac{1}{2}$  inches.

<sup>21</sup> About 13 pounds of sawdust are required to pack 32 pounds of grapes in a keg, thus making the total weight about 45 pounds.

<sup>22</sup> Approximate inside dimensions, 7 $\frac{1}{2}$  by 15 by 18 $\frac{1}{2}$  inches.

<sup>23</sup> Approximate inside dimensions, 10 by 13 by 25 inches.

<sup>24</sup> Approximate inside dimensions, 8 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 18 inches.

<sup>25</sup> Approximate inside dimensions, 12 by 10 $\frac{1}{2}$  by 33 inches.

<sup>26</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 11 by 18 inches.

<sup>27</sup> This average of 55 pounds indicates the usual weight of sweetpotatoes when harvested. Much weight is lost in curing or drying, and the net weight when sold in terminal markets may be far below 55 pounds.

<sup>28</sup> Approximate inside dimensions, 6 by 12 by 24 inches.

(See conversion factors on next page)

## WEIGHTS, MEASURES, AND CONVERSION FACTORS USED IN THE DEPARTMENT OF AGRICULTURE—Concluded.

## OTHER CONVERSION FACTORS.

Commodity.	Unit.	Approximate equivalent.
Apples.....	1 pound dried.....	7 pounds fresh.
do.....	1 pound chops.....	5 pounds fresh.
do.....	1 barrel.....	3 boxes or 3 bushel baskets.
Apricots.....	1 pound dried.....	5½ pounds fresh.
Barley flour.....	1 barrel (196 pounds)...	9 bushels barley.
Beans, lima.....	1 pound shelled.....	2 pounds unshelled.
Buckwheat flour.....	1 barrel (196 pounds)...	7 bushels buckwheat.
Cane sirup.....	1 gallon.....	5 pounds sugar.
Cherries.....	1 pound dried.....	4 pounds fresh in California; 5 pounds fresh elsewhere.
Corn, shelled.....	1 bushel (56 pounds)...	2 bushels (70 pounds) of husked ear corn.
Corn meal:		
Degermed.....	1 barrel (196 pounds)...	6 bushels corn.
Nondegermed.....	do.....	4 bushels corn.
Cotton.....	1 pound ginned.....	2.86 pounds unginned.
Dairy products:		
Butter.....	1 pound.....	21 pounds milk.
Cheese.....	do.....	10 pounds milk.
Condensed milk, whole.....	do.....	2.2 pounds milk.
Evaporated milk, whole.....	do.....	2.2 pounds milk.
Ice cream <sup>29</sup> .....	1 gallon.....	15 pounds milk.
Ice cream <sup>29</sup> (eliminating fat from butter and concentrated milk).	do.....	12 pounds milk.
Malted milk.....	1 pound.....	2.6 pounds milk.
Powdered milk.....	do.....	8 pounds milk.
Powdered cream.....	do.....	19 pounds milk.
Dates.....	1 pound (dried).....	1⅓ pounds fresh.
Eggs.....	1 case (45 pounds).....	35.3 pounds frozen or liquid eggs.
Figs.....	1 pound dried.....	3 pounds fresh in California; 4 pounds fresh elsewhere.
Grapefruit, Florida.....	1 case canned.....	Slightly less than 1 box fresh fruit.
Flaxseed.....	1 bushel.....	Yields about 2½ gallons oil.
Linseed oil.....	1 gallon.....	From 0.4 bushel flaxseed.
Malt.....	1.1 bushels.....	1 bushel barley.
Maple sirup.....	1 gallon.....	8 pounds sugar.
Nuts:		
Almonds, imported.....	1 pound shelled.....	3⅓ pounds unshelled.
Almonds, California.....	do.....	2.22 pounds unshelled.
Brazil.....	do.....	2 pounds unshelled.
Cashews.....	do.....	4.55 pounds unshelled.
Chestnuts.....	do.....	1.19 pounds unshelled.
Filberts.....	do.....	2.22 pounds unshelled.
Pecans:		
Seedling.....	do.....	2.63 pounds unshelled.
Improved.....	do.....	2.38 pounds unshelled.
Pignolias.....	do.....	1.80 pounds unshelled.
Pistachios.....	do.....	2 pounds unshelled.
Walnuts:		
Black.....	do.....	8⅓ pounds unshelled.
Persian (English).....	do.....	2.38 pounds unshelled.
Oatmeal.....	1 barrel (196 pounds)...	10⅞ bushels oats.
Peaches, California.....	1 pound dried.....	5½ pounds fresh.
Peanuts.....	1 pound shelled.....	1½ pounds unshelled.
Pears.....	1 pound dried.....	5½ pounds fresh.
Peas, green.....	1 pound shelled.....	2.5 pounds unshelled.
Prunes.....	1 pound dried.....	2½ pounds fresh in California; 3 to 4 pounds fresh elsewhere.
Raisins.....	1 pound.....	4 pounds fresh grapes.
Rice.....	1 pound milled.....	1.62 pounds rough or unhulled rice.
Rye flour.....	1 barrel (196 pounds)...	6 bushels rye.
Sugar.....	1 ton raw.....	Hawaii, 0.9617 ton refined; Puerto Rico and Philippines, 0.946 ton refined; Cuba, 0.9418 ton refined, beginning with the 1931-32 season; Louisiana (96° raw), 0.9346 ton refined, beginning 1919; Florida (96° raw), 0.9346 ton refined, beginning 1928.
Tobacco.....	1 pound stemmed.....	Various weights of unstemmed, according to the type of tobacco. (See Circular 435, U. S. Dept. of Agriculture.)
Wheat flour.....	1 barrel (196 pounds)...	4.7 bushels wheat. <sup>30</sup>
Wool.....	1 pound scoured.....	2 pounds grease.
do.....	1 pound pulled.....	1⅓ pounds grease.

<sup>29</sup> The milk equivalent of ice cream per gallon is 15 pounds. Reports from plants indicate about 81 per cent of the butterfat in ice cream is from milk and cream, the remainder being from butter and concentrated milk. Thus the milk equivalent of the milk and cream in a gallon of ice cream is about 12 pounds.

<sup>30</sup> This figure (4.7) has been used for conversions relating to the period 1921-39. Because of changes in milling processes, the following factors have been used for earlier periods: 1790-1879, 5 bushels; 1880-1908, 4.75 bushels; 1909-17, 4.7 bushels; 1918 and 1919, 4.5 bushels; 1920, 4.6 bushels.

## TABLE OF CONTENTS.

---

	PAGE.
FOREWORD .....	5
CROPS, RECENT YEARS.....	7
<p>Illinois summary of the 1941 crops, statistical table showing acreage, yield, production, price, and value for ten years, 1932-1941, and ten-year average (1930-39). Summaries from the 1940 Census by Counties.</p>	
LIVESTOCK .....	27
<p>Illinois summary of the 1942 estimates with comparisons (1931-40); marketings and inshipments by months since 1931; Illinois and United States pig crop estimates since 1930.</p>	
DAIRY AND POULTRY STATISTICS.....	35
<p>Illinois estimates of total milk production, utilization, and income, creamery butter production, ice cream production, American and other cheese production, evaporated and powdered milk production, milk production in herds of reporters by months. Data on numbers and value of chickens, production and value of chickens and eggs, and income; egg production in flocks of crop reporters, by months, since 1930; data on numbers, value, production, and income from turkeys.</p>	
ILLINOIS PRICES RECEIVED BY FARMERS.....	45
<p>Illinois and United States indexes of prices received by farmers; Illinois monthly prices received by farmers for 35 items; and monthly prices received by farmers by crop reporting districts for 14 items.</p>	
MISCELLANEOUS .....	67
<p>Illinois weather data; 1941 weather summary; cost of producing corn, oats and wheat; corn crop by classes; wheat harvested by combines; farm wages; corn harvested with mechanical pickers; cash income from farm production; grain stocks on farms; tax levies.</p>	
UNITED STATES STATISTICS.....	77
<p>Weights and measures; tables showing important data for the United States, including crop production, live stock, chickens and turkeys, dairy products, grain stocks, farm income, etc. Some of these data are shown by States.</p>	
INDEX .....	100

## FOREWORD.

---

Economy, without sacrifice of material most commonly called for, has been the aim in the preparation of this 1941 annual summary of the agriculture of Illinois. The general plan of the report is similar to previous reports. Many of the figures for years previous to 1941 are revisions of earlier estimates.

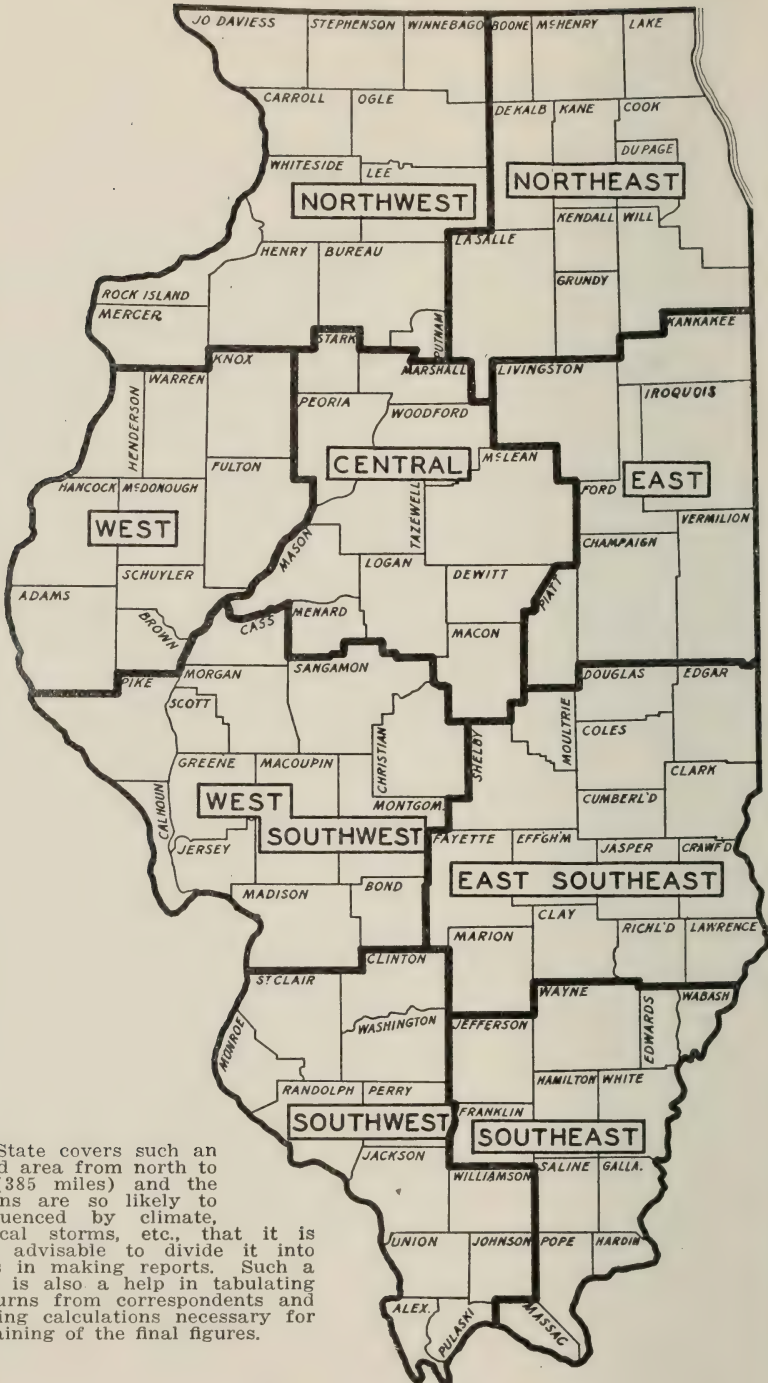

During the past year much data has become available from the United States Census taken in 1940. Fundamental data by counties are included in this summary. Such data include information as to total population, farm population, total land area and farm area, number and value of farms, total value of crops, of livestock, and of livestock products by counties.

County estimates of production and value of the principal crops and of livestock have been made by this service; these estimates are not included in this publication, for reasons of economy, but such county estimates have been published in mimeographed form, and are available upon request to the Illinois Cooperative Crop Reporting Service, Box 429, 509 South Sixth Street, Springfield, Illinois.

The regular publication of reliable agricultural statistics for Illinois as collected and distributed by the Illinois Cooperative Crop Reporting Service is dependent upon the voluntary cooperation of over 25,000 individual farmers and numerous commercial, educational, and governmental agencies in providing the basic data required. The Illinois and Federal Departments of Agriculture gratefully acknowledge the public-spirited cooperation which has made possible the issuance of this publication.

# OUTLINE MAP OF ILLINOIS.

The State covers such an extended area from north to south (385 miles) and the conditions are so likely to be influenced by climate, soil, local storms, etc., that it is deemed advisable to divide it into districts in making reports. Such a division is also a help in tabulating the returns from correspondents and in making calculations necessary for the obtaining of the final figures.

1941.....	18,575,000					502,712,000	-----

<sup>1</sup> To secure total planted soybean acreage add 94,000 acres for 1936, 108,000 for 1937, 160,000 for 1938, 249,000 for 1939, 268,000 for 1940 and 55,000 for 1941. For cowpeas add 16,000 acres for 1936, 5,000 for 1937, 15,000 acres for 1938, 16,000 acres for 1939, 36,000 acres for 1940 and 14,000 acres for 1941. which were plowed under or pastured. Estimates of acreage plowed under and pastured are not available for previous years.

<sup>2</sup> Pounds.

<sup>3</sup> December 1st price.

<sup>4</sup> Per cwt.

<sup>5</sup> Production estimates include only the commercial apple counties in Illinois which are Adams, Pike, Greene, Macoupin, Calhoun, Jersey, Marion, Clay, Richland, Jefferson, Jackson, Williamson, Union, Johnson, Pope, Pulaski and Massac. These data are not comparable with former "Commercial estimates" which represented sales for fresh consumption only in the entire State. Price and value estimates prior to 1939 are pending revision.

<sup>6</sup> Per thousand.

<sup>7</sup> The average value per acre of all crops, excluding fruits, listed in the above Illinois crop summary table is: 1930, \$13.63; 1931, \$8.84; 1932, \$9.10; 1933, \$11.38; 1934, \$14.39; 1935, \$16.68; 1936, \$19.74; 1937, \$18.63; 1938, \$15.11; 1939, \$18.89; 1940, \$19.09; 1941, \$26.75.

## TRUCK CROPS, COMMERCIAL (for market and for processing).

	For market.	For processing.	Total.
	<i>acres</i>	<i>acres</i>	<i>acres</i>
10 year average, 1930-39.....	21,790	90,790	112,580
1940.....	19,420	79,720	99,140
1941.....	19,620	100,200	119,820

## TRUCK CROPS FOR SHIPMENT.

Estimates of the commercial acreage, yield per acre and production of specified truck crops grown primarily for shipment.

## ASPARAGUS (for market and canning).

	Acres.	Yield per acre.	Unit.	Production.	Price.	Farm value.	
						Total.	Per acre.
10 year average, 1930-39.....	4,040	62	crates	243,000	\$1.46	\$340,000	\$85.50
1940.....	4,400	56	crates	246,000	1.30	320,000	72.80
1941.....	4,700	64	crates	301,000	1.40	421,000	89.60

## BEANS (snap).

10 year average, 1930-39.....	1,610	43	bus.	69,000	\$ .96	\$65,000	\$40.72
1940.....	1,600	45	bus.	72,000	1.00	72,000	45.00
1941.....	1,700	45	bus.	76,000	1.25	95,000	56.25

## CANTALOUPE.

10 year average, 1930-39.....	1,030	69	crates	72,000	\$ .84	\$59,000	\$56.30
1940.....	1,200	50	crates	60,000	.80	48,000	40.00
1941.....	1,140	50	crates	57,000	1.20	68,000	60.00

## CABBAGE (for market).

10 year average, 1930-39.....	2,460	64	tons	15,550	\$17.36	\$217,600	\$ 93.13
1940.....	2,400	56	tons	13,400	4.40	59,000	24.64
1941.....	2,200	60	tons	13,300	21.05	280,000	126.30

## CARROTS.

10 year average, 1930-39.....	310	427	bus.	133,000	\$0.57	\$75,000	\$243.16
1940.....	150	300	bus.	45,000	.45	20,000	135.00
1941.....	150	425	bus.	64,000	.70	45,000	297.50

## CUCUMBERS.

10 year average, 1930-39.....	890	64	bus.	58,000	\$0.79	\$46,000	\$49.77
1940.....	1,200	88	bus.	106,000	.90	95,000	79.20
1941.....	1,500	98	bus.	147,000	1.00	147,000	98.00

## ONIONS.

10 year average, 1930-39.....	530	108	sacks	58,000	\$1.21	\$66,000	\$122.31
1940.....	370	130	sacks	48,000	1.15	55,000	149.50
1941.....	350	115	sacks	40,000	1.75	70,000	201.25

## SPINACH (second early).

10 year average, 1930-39.....	120	184	bus.	22,000	\$0.44	\$10,000	\$84.64
1940.....	70	190	bus.	13,000	.30	4,000	57.00
1941.....	70	145	bus.	10,000	.60	6,000	87.00

## SPINACH (late).

10 year average, 1930-39.....	720	131	bus.	99,000	\$0.54	\$51,000	\$67.52
1940.....	350	60	bus.	21,000	.30	6,000	18.00
1941.....	600	100	bus.	60,000	.60	36,000	60.00

## TRUCK CROPS FOR SHIPMENT—Concluded.

## STRAWBERRIES.

	Acres.	Yield per acre.	Unit.	Production.	Price.	Farm value.	
						Total.	Per acre.
10 year average, 1930-39....	5,330	52	crates	281,000	\$2.43	\$639,000	\$121.77

<sup>1</sup> Computed from the value of milk, cream and farm butter sold divided by the quantity of milk or butterfat used in the preparation of these products for market.<sup>2</sup> Computed as difference between cash income and gross income from dairy products.<sup>3</sup> Milk utilized for products sold and for products consumed in the farm household valued at average returns for milk utilized in products sold. Prices shown are those currently used for computing values. In some instances these have been since revised, but no income revisions will be made until 1940 Census data are available.<sup>4</sup> Preliminary.

## ILLINOIS DISPOSITION OF MILK PRODUCED ON FARMS.

Year.	Milk fed or consumed on farms where produced.				Milk sold or utilized in preparation of dairy products sold from farms.				
	Fed to calves.	Consumed in the farm household.		Total used on farms.	In farm churned butter sold.	In wholesale deliveries to plants, dealers, etc.		In retail sales of milk and cream by farmers. <sup>1</sup>	Total utilized in products sold.
		As milk or cream.	As farm butter.			As Cream	As Milk

### ILLINOIS FARM WAGES PER MONTH WITHOUT BOARD

### ILLINOIS FARM INCOME — 1924 — 1941

## 1941 WEATHER SUMMARY FOR ILLINOIS.

E. W. HOLCOMB, *State Meteorologist.*  
UNITED STATES WEATHER BUREAU.  
Springfield, Illinois.

### GENERAL SUMMARY.

This was one of the five warmest years of Illinois climatological history; only 1921, 1931, 1933, and 1938 have averaged warmer in the 52 years of record. Monthly means were above normal in all months excepting February and March. Unseasonably warm weather prevailed in January, April, May, June, and from August through December, mean temperatures for April and May being more than 4° above normal and for December more than 6° above; January averaged more than 15° warmer than the record cold January of 1940; the unusually warm April included the warmest Easter Sunday in the 52 years of record. Sub-zero temperatures during January and February were restricted largely to the northern half of the State. March was unseasonably cold, averaging 4° below normal, with sub-zero temperatures being registered during the month at a few scattered northern stations.

The year's precipitation for the State was approximately 8% above normal despite persistence of drought conditions through March, which month was the fourth driest March of record, and combined with February was the all-time driest for a similar two-month period in the 52 years of record. In sharp contrast October was the wettest for that month in Illinois climatological history, while September and October combined were the wettest two months of State-wide record. Outstanding individual monthly totals for October included 16.56 inches at Galesburg, 14.75 inches at Monmouth, and 14.63 inches at Waverly, and numerous stations had monthly amounts ranging between 10 and 13 inches. Annual snowfall averaged approximately three inches below the normal; January and March snowfall approximated the normal while that for November averaged somewhat above.

The last killing frost of spring generally occurred on April 25th in the northern third of the State and on March 29th in the central and south. The first killing frost in autumn occurred about October 29th. Generally this made a growing season of approximately 187 days in the northern portion and 214 days in the central and south.

Sunshine was considerably below normal in January, in June over north and central sections, and in October and December; it was near or above normal generally in February, March, May, July, August, September, and in the southern third of the State in June.

Storm damage from wind, hail, and lightning during the year amounted to an estimated \$913,975. Tornadoic storms of restricted area and comparatively light damage occurred at Grafton and Thayer on April 19th and in localities of Sangamon and Logan counties in the central part of the State on October 4th. Seven persons were killed, principally by lightning, and a total of 19 persons injured by wind or lightning during the year.

While the deficiency in sub-soil moisture during the winter and early spring was pronounced in numerous localities, rather timely showers in March and near normal rains in April and May brought temporary relief of great value to seasonal crops. By the close of April winter wheat had improved generally, and oats were practically all sown. Following sub-normal temperatures in February and March, comparatively mild weather characterized the month of April and greatly promoted crop progress. May to August rainfall for the State collectively averaged only 1.64 inches below normal; however, a number of scattered stations, particularly in the southwest-central, had a persistent deficiency during this period amounting to several inches. This, considering the general accumulated sub-soil moisture shortage, created unfavorable local crop situations. Also combined influence of high temperature and deficient rainfall during the latter part of July and fore part of August caused some crop deterioration, particularly in the drier areas. Dur-

ing the late summer plowing was delayed in areas, lack of sub-soil moisture intensified locally, and in localities of the south water supply became inadequate. The excessively wet fall months favored good growth of alfalfa, clover, grass crops, and winter wheat that had been sown; in addition much of the accumulated sub-soil moisture deficiencies that had reduced water reserves to a record minimum, were largely overcome in many localities by the heavy September and October rains. On the other hand, wet soil and frequent showers hindered fall plowing, seeding of winter grain, and harvesting of corn and soybeans. Much of the latter which is accomplished by mechanical means was at a standstill for considerable periods due to the wet soil conditions; much winter wheat was of necessity sown undesirably late, and there was even some curtailment in acreage from that cause.—C.L.R.

**WEIGHTS, MEASURES, AND CONVERSION FACTORS USED IN THE DEPARTMENT OF AGRICULTURE—Continued.**

**OTHER CONVERSION FACTORS.**

Commodity.	Unit.	Approximate equivalent.
Apples.....	1 pound dried.....	7 pounds fresh.
do.....	1 pound chops.....	5 pounds fresh.
do.....	1 barrel.....	3 boxes or 3 bushel baskets.
Apricots.....	1 pound dried.....	5½ pounds fresh.
Barley flour.....	1 barrel (196 pounds).....	9 bushels barley.
Beans, lima.....	1 pound shelled.....	2 pounds unshelled.
Buckwheat flour.....	1 barrel (196 pounds).....	7 bushels buckwheat.
Cane sirup.....	1 gallon.....	5 pounds sugar.
Cherries.....	1 pound dried.....	4 pounds fresh in California; 5 pounds fresh elsewhere.
Corn, shelled.....	1 bushel (56 pounds).....	2 bushels (70 pounds) of husked ear corn.
Corn meal:		
Degermed.....	1 barrel (196 pounds).....	6 bushels corn.
Nondegermed.....	do.....	4 bushels corn.
Cotton.....	1 pound ginned.....	2.86 pounds unginned.
Dairy products:		
Butter.....	1 pound.....	21 pounds milk.
Cheese.....	do.....	10 pounds milk.
Condensed milk, whole.....	do.....	2.2 pounds milk.
Evaporated milk, whole.....	do.....	2.2 pounds milk.
Ice cream <sup>29</sup> .....	1 gallon.....	15 pounds milk.
Ice cream <sup>29</sup> (eliminating fat from butter and concentrated milk).....	do.....	12 pounds milk.
Malting.....	1 pound.....	2.6 pounds milk.
Powdered milk.....	do.....	8 pounds milk.
Powdered cream.....	do.....	19 pounds milk.
Dates.....	1 pound (dried).....	1⅓ pounds fresh.
Eggs.....	1 case (45 pounds).....	35.3 pounds frozen or liquid eggs.
Figs.....	1 pound dried.....	3 pounds fresh in California; 4 pounds fresh elsewhere.
Grapefruit, Florida.....	1 case canned.....	Slightly less than 1 box fresh fruit.
Flaxseed.....	1 bushel.....	Yields about 2½ gallons oil.
Linseed oil.....	1 gallon.....	From 0.4 bushel flaxseed.
Malt.....	1.1 bushels.....	1 bushel barley.
Maple sirup.....	1 gallon.....	8 pounds sugar.
Nuts:		
Almonds, imported.....	1 pound shelled.....	3⅓ pounds unshelled.
Almonds, California.....	do.....	2.22 pounds unshelled.
Brazil.....	do.....	2 pounds unshelled.
Cashews.....	do.....	4.55 pounds unshelled.
Chestnuts.....	do.....	1.19 pounds unshelled.
Filberts.....	do.....	2.22 pounds unshelled.
Pecans:		
Seedling.....	do.....	2.63 pounds unshelled.
Improved.....	do.....	2.38 pounds unshelled.
Pignolias.....	do.....	1.30 pounds unshelled.
Pistachios.....	do.....	2 pounds unshelled.
Walnuts:		
Black.....	do.....	8⅓ pounds unshelled.
Persian (English).....	do.....	2.38 pounds unshelled.
Oatmeal.....	1 barrel (196 pounds).....	108⅔ bushels oats.
Peaches, California.....	1 pound dried.....	5½ pounds fresh.
Peanuts.....	1 pound shelled.....	1½ pounds unshelled.
Pears.....	1 pound dried.....	5½ pounds fresh.
Peas, green.....	1 pound shelled.....	2.5 pounds unshelled.
Prunes.....	1 pound dried.....	2½ pounds fresh in California; 3 to 4 pounds fresh elsewhere.
Raisins.....	1 pound.....	4 pounds fresh grapes.
Rice.....	1 pound milled.....	1.62 pounds rough or unhulled rice.
Rye flour.....	1 barrel (196 pounds).....	6 bushels rye.
Sugar.....	1 ton raw.....	Hawaii, 0.9617 ton refined; Puerto Rico and Philippines, 0.946 ton refined; Cuba, 0.9418 ton refined, beginning with the 1931-32 season; Louisiana (96° raw), 0.9346 ton refined, beginning 1919; Florida (96° raw), 0.9346 ton refined, beginning 1928.
Tobacco.....	1 pound stemmed.....	Various weights of unstemmed, according to the type of tobacco. (See Circular 435, U. S. Dept. of Agriculture.)
Wheat flour.....	1 barrel (196 pounds).....	4.7 bushels wheat. <sup>30</sup>
Wool.....	1 pound scoured.....	2 pounds grease.
do.....	1 pound pulled.....	1⅓ pounds grease.

<sup>29</sup> The milk equivalent of ice cream per gallon is 15 pounds. Reports from plants indicate about 81 per cent of the butterfat in ice cream is from milk and cream, the remainder being from butter and concentrated milk. Thus the milk equivalent of the milk and cream in a gallon of ice cream is about 12 pounds.

<sup>30</sup> This figure (4.7) has been used for conversions relating to the period 1921-30. Because of changes in milling processes, the following factors have been used for earlier periods: 1790-1879, 5 bushels; 1880-1908, 4.75 bushels; 1909-17, 4.7 bushels; 1918 and 1919, 4.5 bushels; 1920, 4.6 bushels.

# WEIGHTS, MEASURES, AND CONVERSION FACTORS USED IN THE DEPARTMENT OF AGRICULTURE—Concluded.

<sup>1</sup> Standard bushel used in the United States contains 2,150.42 cubic inches; the gallon, 231 cubic inches, the cranberry barrel, 5,826 cubic inches, and the standard fruit and vegetable barrel, 7,056 cubic inches. Such large-sized products as apples and potatoes sometimes are sold on the basis of a heaped bushel, which would exceed somewhat the 2,150.42 cubic inches of a bushel basket level full. This also applies to such products as sweet potatoes, peaches, green beans, green peas, spinach, etc.

<sup>2</sup> Approximate inside dimensions, 10 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 18 inches.

<sup>3</sup> Approximate inside dimensions, 4 $\frac{1}{2}$  by 16 by 16 $\frac{1}{2}$  inches.

<sup>4</sup> Approximate inside dimensions, 9 $\frac{1}{2}$  by 11 by 20 $\frac{1}{2}$  inches.

<sup>5</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>6</sup> Approximate inside dimensions, 4 $\frac{3}{16}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>7</sup> Approximate inside dimensions, 13 by 18 by 21 $\frac{1}{2}$  inches.

<sup>8</sup> Approximate inside dimensions, 12 by 12 by 22 $\frac{1}{2}$  inches.

<sup>9</sup> This is the weight commonly used in trade practice, the actual weight varying according to temperature conditions.

<sup>10</sup> Approximate inside dimensions, 22 by 16 by 20 $\frac{1}{2}$  inches.

<sup>11</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 14 $\frac{1}{2}$  inches.

<sup>12</sup> The standard weight of 70 pounds is usually recognized as being about 2 measured bushels of corn, husked, on the ear, because it required 70 pounds to yield 1 bushel, or 56 pounds of shelled corn.

<sup>13</sup> For statistical purposes the bale of cotton is 500 pounds gross or 478 pounds net weight. Actual bale weights vary considerably, and the customary average weights of bales of foreign cotton differ from that of the American square bale.

<sup>14</sup> This is the average weight of cottonseed, although the legal weight in some States varies from this figure of 32 pounds.

<sup>15</sup> Approximate inside dimensions, 9 $\frac{1}{2}$  by 10 $\frac{1}{2}$  by 15 inches.

<sup>16</sup> Approximate inside dimensions, 1 $\frac{1}{2}$  by 11 by 16 $\frac{1}{2}$  inches.

<sup>17</sup> Approximate inside dimensions, 12 by 12 by 24 inches.

<sup>18</sup> Approximate inside dimensions, 11 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 24 inches.

<sup>19</sup> Approximate inside dimensions, 5 $\frac{1}{2}$  by 13 $\frac{1}{2}$  by 16 $\frac{1}{2}$  inches.

<sup>20</sup> Approximate inside dimensions, 4 $\frac{1}{2}$  by 16 by 16 $\frac{1}{2}$  inches.

<sup>21</sup> About 13 pounds of sawdust are required to pack 32 pounds of grapes in a keg, thus making the total weight about 45 pounds.

<sup>22</sup> Approximate inside dimensions, 7 $\frac{1}{2}$  by 15 by 18 $\frac{1}{2}$  inches.

<sup>23</sup> Approximate inside dimensions, 10 by 13 by 25 inches.

<sup>24</sup> Approximate inside dimensions, 8 $\frac{1}{2}$  by 11 $\frac{1}{2}$  by 18 inches.

<sup>25</sup> Approximate inside dimensions, 12 by 10 $\frac{1}{2}$  by 33 inches.

<sup>26</sup> Approximate inside dimensions, 3 $\frac{1}{2}$  by 11 by 18 inches.

<sup>27</sup> This average of 55 pounds indicates the usual weight of sweetpotatoes when harvested. Much weight is lost in curing or drying, and the net weight when sold in terminal markets may be far below 55 pounds.

<sup>28</sup> Approximate inside dimensions, 6 by 12 by 24 inches.

# TABLE OF CONTENTS

FOREWORD .....	Page 5
CROPS, ILLINOIS, RECENT YEARS.....	11
State estimates of acreage, yield, production and value of all principal crops, 1935-44; county estimates for years 1939-44, covering ten principal crops; farm disposition and income for all principal crops, recent years.	
CROPS, ILLINOIS, HISTORICAL SUMMARY.....	107
State estimates since 1866 or the beginning of such records through 1935 for all principal crops.	
LIVESTOCK, ILLINOIS .....	139
Covers cattle, hogs, work stock, and sheep. A one page summary of estimated inventory numbers, 1935-44; comparable data arranged according to species for period 1867-35; State inventory estimates broken down according to classes from 1930-45; county estimates of inventory numbers for years 1940-45; pig crop summary from 1925 to date; lamb and wool crop estimates; cattle and sheep on feed; livestock inshipments and marketings.	
DAIRY AND POULTRY, ILLINOIS.....	177
Monthly production of eggs, milk, and important manufactured dairy products; monthly output of chicks by commercial hatcheries; inventory numbers and annual production of chickens and turkeys; farm disposition and income from milk and poultry products; selected county data from the 1940 Federal Census of Agriculture.	
PRICES RECEIVED BY FARMERS, ILLINOIS.....	197
Estimated prices received by farmers for farm products as of the 15th of each month from 1925, or the beginning of the record if later than that date, to 1945; indexes of prices received by farmers by groups of commodities, 1920-45; hog-corn ratios, 1925-45.	
MISCELLANEOUS STATISTICS, ILLINOIS.....	225
Weather data from United States Weather Bureau; selected data from the 1940 Federal Census, including population, farm numbers, tenure; farm stocks of grain; measures of the changing technology of agriculture; farm income; monthly sales of principal crops; farm wages from 1866 to 1945; land values and cash rent; seeding data.	
GRAPHIC SECTION, ILLINOIS.....	249
Farm disposition and geographic distribution of important crops, livestock, and livestock products, and rank of Illinois among other important States.	
UNITED STATES, STATISTICS FOR THE.....	271
Selected crop and livestock data for recent years (by States, for certain items); farm stocks of grain; standard weights and measures.	
INDEX .....	290

## FOREWORD

---

Food is a vital necessity and most civilized countries maintain an organization charged with the responsibility for the collection and issuance at regular intervals of authoritative information regarding its production and supply. Such information in the form of agricultural statistics is essential during normal times to assure reasonably orderly production, processing, and distribution to the end that returns to producer and processor and cost to ultimate consumer shall all bear an equitable relationship to each other.

The war has vastly increased World food requirements while at the same time it has rendered impotent a large part of the World's food producing resources. It has fallen to America, therefore, to fill the war-created gaps in agricultural production to the fullest possible extent. We have a tremendous capacity for production but cannot possibly satisfy entirely the demands of all—domestic, military, lend-lease, and foreign relief. It has been necessary to appraise potential production in the light of past history, encourage production in lines most needed and then provide for distribution that will best meet war and civilian needs. The over-all task can be stated simply but it was and is far from simple. It involves consideration of production capacities of states and counties from the standpoint of soil, topography, climate, equipment and past experience; availability and location of transportation and facilities for processing; machinery and labor supplies and allocations; prices, costs of production, and subsidies for marginal production. It would be an almost impossible task without the wealth of agricultural statistics accumulated during peace-time and the data made available currently.

This publication is a compilation of selected County, State and National data. Reference may be made to previous publications for data not included here. County statistics from the 1940 Federal Census of Agriculture—approximate land area, land in farms, land cropped, etc.; total population, farm population; number of farms; value of farms, value of implements and machinery, value of livestock, value of crops, value of products sold, etc.—may be found in pages 8-13 in Circular No. 443, published in 1942. Monthly prices of important farm commodities starting with 1908 (or the beginning of such records) were published in Circular No. 438, published in 1937.

The regular publication of reliable agricultural statistics for Illinois as collected and distributed by the Illinois Cooperative Crop Reporting Service is dependent upon the voluntary cooperation of over 38,000 individual reporters, the annual State Farm Census, and numerous commercial, educational, and governmental agencies in providing the basic data required.

Formal lists of reporters include 4,300 monthly crop reporters who, in addition to reporting the condition and yield prospects of crops in their community, supply a wide variety of other information relating to such subjects as dairy and poultry production, farm stocks of grain and hay and farm labor. A special list of 3,600 farmers reports on acreage of field crops and acreage utilization of specific crops. Prices received by farmers and prices paid by farmers are reported by 2,300 persons dealing in the products involved. A special dairy production inquiry, which supplements information coming from regular crop reporters, goes out quarterly to 500 dairymen. Thirty-three hundred processors and handlers of agricultural products, including millers, elevator operators, hatcheries and processors of milk, report from one to twelve times annually on the volume of their operations.

Special poultry lists, involving about 900 producers, supply data on commercial egg production and turkey production, which, like the special dairy lists, supplements similar data furnished by regular crop reporters. Inquiries relating to truck crops go to about 2,700 growers. Cattle and sheep

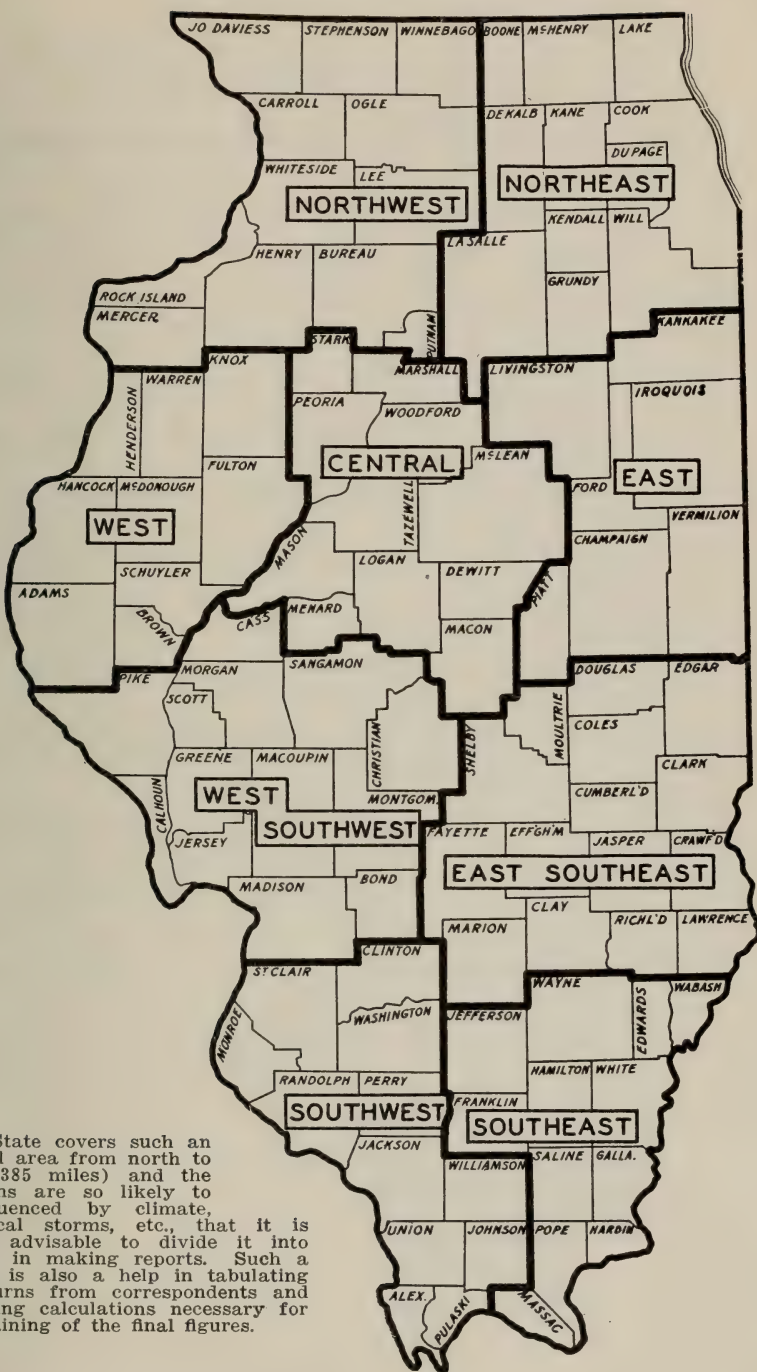

feeding operations are followed through inquiries going to 1,500 feeders. About 7,500 individuals are included in various special commodity lists dealing with fruits, nuts, popcorn, flaxseed, buckwheat, sorghum, hemp, sugar beets, potatoes, sweet potatoes, broomcorn, cotton, hay seeds, and honey.

In addition to schedules returned by the preceding groups, approximately 30,000 individual farm reports on livestock and acreage are returned through the cooperation of the Post Office Department and its rural mail carriers.

The Illinois Farm Acreage Census is taken annually by the local assessors and other township and county officials with administration of work and summarization of results handled by this office. This census provides a permanent record of acreage utilization for every farm in Illinois as well as precise measures of crop acreages for townships, counties and State.

The Illinois and Federal Departments of Agriculture gratefully acknowledge the generous cooperation which has made possible the issuance of this publication.

# OUTLINE MAP OF ILLINOIS

The State covers such an extended area from north to south (385 miles) and the conditions are so likely to be influenced by climate, soil, local storms, etc., that it is deemed advisable to divide it into districts in making reports. Such a division is also a help in tabulating the returns from correspondents and in making calculations necessary for the obtaining of the final figures.

## SOIL TYPE DESCRIPTIONS

For use with "Guide Map" shown on opposite page

---

1. Dark-colored and light-colored upland soils derived from deep loess.
2. Grayish brown prairie and timber soils with imperfectly developed claypan subsoils.
3. Brownish gray strongly leached prairie soils mostly with claypan subsoils.
4. Gray and yellowish gray strongly leached prairie and timber soils mostly with claypan subsoils.
5. Dark- and light-colored moderately leached soils developed on glacial outwash and old lake bed sediments.
6. Dark- and light-colored moderately leached soils developed from thin loess on permeable Wisconsin till.
7. Yellowish gray timber soils developed from deep loess with subsoils of medium permeability.
8. Dark- and light-colored soils, calcareous at 25 to 40 inches, developed from permeable Wisconsin till.
9. Dark- and light-colored moderately leached soils developed on slowly permeable Wisconsin till.
10. Dark- and light-colored moderately leached soils developed from very thin loess on moderately leached Illinoian till.
11. Soils of the Ozark uplift, largely undifferentiated.
12. Undifferentiated soils developed on glacial outwash plains and river terraces, frequently sandy and drouthy.
13. Undifferentiated dark-colored soils developed from stream sediments.
14. Undifferentiated light-colored soils developed from stream sediments.
15. Undifferentiated dark- and light-colored soils, rock outcrops frequent.

## ILLINOIS CROPS

## ANNUAL ILLINOIS CROP SUMMARIES, 1939-1944

## 1939

The total value of principal crops harvested in Illinois in 1939 was approximately 349 million dollars. Corn continued to account for more than half of the total value of all Illinois crops and the value of the soybean crop ranked second, for the first time. Next in rank were all tame hay, winter wheat, and oats, respectively.

Corn yields which averaged 51 bushels per acre for the State were 3 bushels per acre larger than the previous record established in 1937, and soybean yields at 24.5 bushels were 1 bushel above the previous record set in 1938. Wheat yields averaged the second largest on record, and tame hay yields were the second largest in 55 years. Oats, rye, and barley yields were near average, and fruit production was well above average.

The acreage of corn in 1939 was less than in any preceding year since 1874, with the exception of 1934. The record yield of corn in 1939 was attributed partly to the large acreage of hybrid corn. Only about 25 percent of the total corn acreage was planted with hybrid seed in 1937; this increased to 48 percent in 1938 and to 66 percent in 1939.

The soybean acreage was the largest of record to that time. More than 2½ million acres—were harvested either for hay or for beans in 1939. Yields during 1939 for both hay and beans were also record highs. Illinois produced more than half of the total U. S. crop of soybeans harvested for beans in 1939, and her production was more than three times that of any other state.

Quality of most crops in 1939 was well above average. Corn quality for the most part was excellent; however, there was some shrinkage due to forced maturity by the exceptionally hot, dry weather during September, and since the crop became so dry, there was more than usual shelling in handling at harvest time. Soybean quality was above average, but hot, dry weather in September forced a too-rapid maturing of soybeans which had grown quite rank during the wet weather in August. As the result, there were more green beans and more cracking of beans at harvest time than usual and in addition germination quality of the seed was injured. 1939 was an abundant hay year, with quality varying from below average due to frequent rains during the harvest of earlier hay crops to above average for later cuttings. Wheat, barley, and rye quality averaged only fair, while oats quality for the most part was poor.

Temperatures during January, February, and the first half of March averaged above normal.

Total precipitation for the first two and one-half months of the year was above normal. The heaviest snow in 24 years fell over the northern two-thirds of Illinois on January 29th. February snowfall, however, was only about one-half of normal, but ample rainfall was well distributed over the State during the month. These soaking rains fell upon ground that was not frozen and did much to improve surface and subsoil moisture conditions. The resulting muddy fields and soft roads delayed farm work and hindered marketings during February and early March.

The last ten days of March were unseasonably warm and dry and farm work advanced very rapidly. Southern Illinois cherry, apricot, and plum trees were in full bloom by April 1st, and peach trees were starting to bloom. Cold weather the first few days of April and killing frosts April 12th-13th injured this fruit.

Rainfall continued above normal during April, and temperatures until the last week or ten days were below normal. This cool, wet weather re-

tarded plant growth and delayed spring soil preparation and planting. Farm work was about two weeks behind schedule at the end of the month.

The last week of April turned off warm, followed by cool weather during the first week of May which was accompanied with the last killing frost of the season for northern Illinois on May 3rd. Temperatures during the rest of May averaged well above normal, but rainfall was considerably below normal. Crop growth was not retarded by the dry weather because of ample soil moisture resulting from the heavy April rains. Farm work advanced at a rapid rate, and by June first, corn planting was 96 percent completed and soybean planting 76 percent completed.

Temperatures during June and July averaged about normal. Rainfall was above normal during June and about normal during July.

The first three weeks of August were very cool and wet and resulted in one of the wettest Augusts on record. The ample rainfall improved soil for fall plowing, renewed pastures, resulted in rank growth of soybeans and abundant weed growth, and aided the rapid spread of corn rots and molds.

The last week of August turned off hot and dry, and was the start of the longest fall drought on record. September proved to be the fourth warmest September in fifty years, and the driest September on record. This prevented further rank growth of soybeans, checked corn rots and molds, and hastened corn and soybean maturity. Some new corn was grading No. 2 by October 1st. The hot weather also damaged late apples by reducing keeping quality and was responsible for a heavy drop.

The dry weather continued for the balance of the year. Rainfall was less than half of normal during the four-month period, September through December.

The warm, dry weather was very favorable for late harvest operations but delayed fall plowing and seeding, and resulted in uneven germination of fall-sown grains. Corn husking was 65 percent completed and soybean harvesting 85 percent completed by November 1st and both operations were nearly completed by December 1st which are high records. All crops matured ahead of the first killing frosts which covered northern Illinois on October 1st and the entire State on October 14th and 15th.

## 1940

The aggregate farm value of the principal crops produced in Illinois in 1940 was 354 million dollars. Corn lead all other crops in value, accounting for 201 million dollars or 57 percent of the total. Oats ranked second with 44 million dollars, hay third with 31 million dollars, soybeans for beans fourth with 30 million dollars, and wheat fifth with 28 million dollars. Illinois produced 43 percent of the nation's soybean crop in 1940. The total acreage of crops harvested at 18.3 million acres was down slightly from 1939. Increases in the acreages of tame hay, soybeans, cowpeas, oats, sorghums, broomcorn, and potatoes were offset by decreased acreages of corn, wheat and other crops. Total soybean acreage made a new high record and tame hay acreage was the largest since 1924.

The 1940 aggregate production of corn for grain, wheat, oats, barley and rye was almost a tenth less than in 1939 but over a tenth more than the 1929-38 average. Hay and forage production (including silage and sorghums) was slightly above last year and very substantially above average. Soybean production was nearly a fourth less than in 1939 but more than double the 1929-38 average. The tonnage of tree fruits was about half of the 1939 production.

Illinois corn production at 329 million bushels was a fifth less than the 1939 crop. The 1940 corn yield was below the previous three years but was equal to or above any yield prior to 1937 because of the increased acreage of hybrid corn, use of better land for corn, increased use of power machinery, and improved soil fertility. Oats and barley yields were the highest on record. Winter wheat yield was exceeded only in 1931 and spring wheat yield was the best since 1918. Early hay crops were very good but later cuttings were hurt by drought. Production on the record acreage of soybeans for beans was down sharply from the record 1939 crop due to the lower yield, caused mainly by adverse weather, weeds, and below-average quality

of seed. Production of red and alsike clover seed was the largest on record. Lespedeza seed production was only a third as large as in 1939. Broomcorn production was a fourth larger than in 1939 and of excellent quality. Apple and peach crops were small. A late winter freeze caused a failure in peaches except in the Massac-Pulaski-southern Union County area. Apple production in the 17 commercial counties was less than half of the 1939 production and about a third less than the 1934-38 average. The pear and grape crops were larger than average.

The first month of the year was the coldest January of record, but heavy snow cover falling in December and early January protected winter crops. Some damage was done to tree fruits especially peaches. In general the year 1940 was marked by much dry and cool weather and the most acute shortage of stock water on farms in years, especially over central and southern Illinois. April, August, November, and December were the only months since August 1939 that had normal or near-normal rainfall. Northern and upper west central Illinois were the more favored rainfall areas. Rainfall deficiency was the most severe in the upper east central and southeastern counties, resulting in materially reduced yields of corn and soybeans. April rains coupled with rather cool weather to mid-July resulted in most spring-planted crops being later than usual but were very favorable for both yields and quality of small grain crops. A cumulative shortage of soil moisture was reflected by short pastures in June but did not affect early hay crops materially. Conditions were favorable for the care and cultivation of corn and soybeans. Excessive heat and dry weather from July 21 to August 6 came too late to damage small grains but corn fired badly. Showers on the latter date and successive rains brought August precipitation up to above normal in the northern and central divisions of the State and to about 80 percent of normal in the southern division but for the most part the rains came too late to help corn to any great extent.

Except in the northern counties, small grains were secured in good condition. Minimum temperatures ranged as low as 29° at scattered stations in central and northern Illinois September 26 and 27 but the bulk of the corn and soybean crops was too far advanced to be damaged. With favorable weather for the purpose, the harvest of corn and soybeans was largely completed during October and November.

A sudden cold wave struck the State about Armistice Day which resulted in some later losses of fall sown grains and damage fruit trees (largely apples). Losses of poultry from smothering and freezing were also reported. The extreme cold wave was of short duration with temperatures returning to about normal in a few days.

Soil conditions were better for fall seeding than in 1939 and this largely accounted for an increased acreage of winter wheat sown for harvest in 1941. The crop went into the winter with growth varying from backward and uneven to good, with lowest condition in the more severe drought area of southeastern Illinois. The cold wave in November caused some loss of wheat which was not immediately apparent.

### 1941

The total farm value of the principal Illinois crops produced in 1941 was 540 million dollars or over a half larger than the value of 1940 production. Corn accounted for 303 million dollars or 56 percent of the total. Soybeans for beans ranked second at 76 million dollars. Next in rank were oats, wheat, and tame hay. The total acreage of all crops harvested at 18.8 million acres was about three percent above the previous year's total.

The 1941 aggregate production of corn and small grain was a seventh larger than in 1940 and almost a fourth larger than the ten-year average. Hay and forage production, including silage and sorghums, was about a tenth less than in 1940 but not much different than average. Soybean production was 41 percent above and cowpeas 11 percent less than the 1940 crops. Redtop and lespedeza seed production held up well but other seed crops were only fair to light. Red clover seed was not much over a third of the 1940 crop. Excepting Calhoun, the leading apple county in Illinois, tree fruits were fair to large crops. Early truck crop yields were good but mid-summer

and late summer crops were unevenly poor to good, due to varying drought. The 1941 cotton crop at 5,900 bales was the largest since estimates began in 1924. Broomcorn was a good crop although the acreage was down from a year ago.

The year 1941 was the fifth consecutively in which the combined production of all Illinois crops totalled above average. The years 1937 and 1939 produced abundant crops rather generally, while in 1938, 1940, and 1941, crops were more irregular. While 1941 was a profitable year to the majority of farmers, it was marked by wide variations and some extremes. It also was a difficult year for most farmers due to the tightening labor supply.

Comparatively mild weather in January was followed by cold dry weather in February and March. Winter crops and grasses were kept dormant and losses from heaving were at a minimum. Some stock water shortages were reported in March but this situation was relieved by near normal rainfall in April. The planting season opened early with conditions favorable for advancing field work. Planting of small grain was timely and by June 1 most of the corn was up and soybean planting was well advanced with many fields up. Subsoil moisture was short, but timely showers were sufficient for good crop growth until near mid-season. Excessive heat developed the last ten days of June which hastened maturity of small grains, caused some reduction in quality of wheat and reduced yield prospects for oats. This was followed by uneven drought damage—mainly in the lower half of the State—in late July and early August. Rains occurring on and after August 11 revived pastures and late hay and bolstered the condition of row crops. From September on, the season was extremely wet. October was the wettest for that month ever recorded. Harvest of the later crops was one of the slowest and most difficult on record. Frost damage was negligible but some spoilage of corn, soybeans, cowpeas, and hay occurred because of the excessive rainfall. About 10 percent of the corn and 15 percent of the soybeans were still unharvested at the beginning of the new year. Production of most crops ranged from fair to large but it was an off year for quality of many crops. Hybrid seed was used in planting 87 percent of Illinois' corn acreage in 1941. Corn yield per acre at 53.0 bushels, and soybean production at 49 million bushels set new high records this season and led all other States. Pasture conditions varied considerably but were better than average, especially during the fall and mild early winter season. This was welcomed since it helped to conserve rather limited hay supplies in southern and some central areas.

Heavy rains seriously delayed seeding of winter wheat from the last week of September until mid-November in all but the northern third and about the southern fifth of the State. Considerable acreage intended earlier for wheat was not seeded, although a sizeable acreage was sown after November 15. Warm days and plentiful moisture favored wheat which was sown, however, on the first of December height varied from grain not yet up to 4 or 5 inches, depending on date of seeding. Stands were fair to good except for scattered low spots thinned or drowned out.

## 1942

The total farm value of the principal Illinois crops produced in 1942 was 642 million dollars, nearly a fifth larger than their 1941 value of 540 million dollars. This was the fourth highest gross value of previous record, having been exceeded only by the World War I years of 1917, 1918, and 1919. Corn accounted for 375 million dollars or 58 percent of the total. Soybeans for beans ranked second at 106 million dollars, 40 percent larger than the previous record of 76 million dollars for the 1941 crop. Next in rank were oats, tame hay, and wheat. The total acreage of crops harvested in 1942 at 18.8 million acres was about the same as that harvested a year previously.

This was a year of many new records (both highs and lows) for Illinois crops. High records included the yield per acre of corn at 54.0 bushels (which exceeded last year's record by a bushel) and the acreage and production of both soybeans for beans and alfalfa hay. Ninety-three percent of the corn acreage was planted with hybrid seed compared with the previous top of eighty-seven percent in 1941. The low records included the acreage

of wheat harvested, broomcorn acreage and production, and the yield per acre of red clover seed. Except for 1912, this year's wheat production was the smallest on record.

The aggregate production of grains (corn for grain, oats, barley, and rye) in 1942 was 5 percent less than in 1941 but a fifth larger than the 1930-39 average. Hay and forage production (including silage) was  $2\frac{1}{2}$  percent larger than last year and 10 percent larger than average. Hay quality is below average as much hay was damaged by rains. Soybean yield per acre at 20.5 bushels was a half bushel less than in 1941 but production was 35 percent larger and nearly  $3\frac{1}{2}$  times as large as the 1930-39 average. Tree fruit tonnage was about a third less than the 1941 crop and a seventh less than average.

Temperatures as much as 16 to 20 degrees below normal in early January reduced peach prospects and since adequate snow cover was lacking, it resulted in some killing of winter wheat and winter barley. Spring work was retarded somewhat by wet soil conditions through March but April turned off dry and planting of spring sown grains was in good season. Grasses and small grains made good growth during May but the month was too wet for normal progress of field work. June and the first half of July were still wetter with bottom lands being flooded in late June and early July. Because of these conditions, the planting of corn and soybeans was late, and there was more replanting than usual, especially in the southern half of Illinois. Altogether, planting stretched out the longest since 1935. Cultivation of row crops was handicapped by frequent rains and wet fields. Crops in general fared better on uplands than on bottom lands. June and July rains in lower Illinois interfered with pollination of oats and were adverse for the harvest of small grains and hay. Oats yields in the northern third of the State held up well. Rapid development during nearly ideal August and September weather resulted in most of the corn and two-thirds of the soybeans maturing ahead of the unusually early frosts of September 22 to 29. Due to ideal drying weather in October about 60 percent of corn picking and 70 percent of soybean combining was completed by November 1. However, about 15 percent of the corn and 20 percent of the soybeans still were unharvested by December 31 due to rain and snow delays in November and December.

Seeding of winter wheat was a little later than usual and germination was slow and somewhat uneven because of dry topsoil. However, the warm wet November resulted in rapid germination and growth so that the crop was in good condition (but short) by the time freezing weather arrived in late November.

### 1943

The aggregate farm value of the principal Illinois crops produced in 1943 was 779 million dollars or 21 percent larger than the 1942 total of 642 million dollars. The value of crop production was the highest to that time since 1919 and was primarily the result of record and near-record production of soybeans and corn, respectively, and generally higher market prices. Production of the three other major crops was below average—oats and hay only slightly but winter wheat very sharply below. The combined production of all crops in 1943 was above average, an outstanding accomplishment on the part of Illinois farmers in view of the unpromising early season outlook and the tight farm labor and machinery situation.

The value of grain produced (all corn, wheat, oats, barley, and rye) at 555 million dollars was 20 percent higher than in 1942, although production was about the same. Corn production, for all purposes, at 419 million bushels was 1 percent larger than last year and represented the fifth largest crop in eighty years of record. Both production and value of soybeans exceeded previous all time highs established a year previously. Tame hay production was slightly below average and 18 percent under 1942.

For the State as a whole the combined production of all crops was large, but the distribution was more uneven than normally. A winter more severe than usual, and a March which contributed alternate freezes and thaws with resultant heaving, caused substantial losses of winter grains and hay. The period, January through March, was abnormally dry, but excessive rainfall

in April and May and cool weather during all but the last week of Spring, made the planting season late. Work was delayed and germination of small grain was slow. Floods in late May and additional heavy rains in June caused further delay, much replanting, and some losses which were irretrievable. In general, crops started from two to four weeks behind schedule. July and August were abnormally hot and dry, and drought was severe, particularly in southeastern Illinois and to a lesser extent in some central counties. Elsewhere soil moisture held up better and the hot weather forced late crops which largely reached maturity and produced fair to large yields before the first killing frost which came at about the normal date. For the most part, harvest weather was ideal, which permitted the fullest possible use of available machinery and man power and earlier than usual completion of harvest.

Yields of truck crops, although about average, were in general definitely lower than a year earlier on an acreage which was about two percent smaller than in 1942. It was an off year for all fruits which were light crops.

Droughty conditions early in the fall, mainly in parts of central Illinois, slowed plowing and seedbed preparation for winter wheat and resulted in uneven germination but were largely offset by rainfall later. Although top growth was a little short on December 1, the condition of the crop on that date was reported to be 86 percent of normal.

### 1944

Aggregate farm value of 1944 Illinois crop production was double the ten-year (1933-42) average and the second highest of record. Valued at 805 million dollars, 1944 crop production was worth 3 percent more than that of 1943. The near high record for 1944 was due primarily to high market prices although production was substantially above the ten-year average.

Total harvested acreage in 1944 was up three percent from a year ago. Yields were generally higher than during the 1933 to 1942 period.

Production of grains was large although somewhat smaller than in 1943. Corn production was a fifth larger than the ten-year average although 4 percent below that of 1943. A new high record was established for soybean production in 1944. The seed crops were mostly larger than during the preceding year due primarily to larger acreages harvested. Tame hay yields were above those for both 1943 and the 10-year average, but total harvested acreage was relatively low and consequently production although 4 percent above that for 1943 was a like percentage less than the 10-year average. Fruit production was below average except for peaches, and apple production was even smaller than the short crop of 1943.

Corn planting was slow in getting started but once underway proceeded rapidly and was largely completed by the usual time. The crop passed through a period of drought which was accompanied by one of the most severe chinch bug infestations of record. Loss of acreage and reduction in yields due to these factors were most pronounced in lower central Illinois and the southeastern quarter of the State. There was very little frost damage to this year's crop, but a substantial part of it was high in moisture at harvest time.

Most of the soybean crop was planted at about the normal time, although some growers in southern Illinois were delayed to the point where soil conditions had become too dry for uniform germination of seed. The soybean crop was not damaged by chinch bugs and yields were more generally favorable than for corn. Occurrence of the first hard general frost was somewhat later than normal, and the month of October was ideal for soybean combining. Harvest of a high quality crop was largely completed by November 1.

Winter wheat production was nearly double that of 1943 due to increases in both acreage and yield per acre. The crop reached harvest with practically no loss of acreage other than that due to floods during late April. It was hurried along by warm dry weather and reached maturity earlier than usual and ahead of the drought.

Excessive precipitation beginning early in March and extending well past the first of May set back oats seeding the latest on record and resulted in a marked reduction of acreage from earlier intentions.

Yields from first crop alfalfa and clover-timothy were quite heavy as a result of ample moisture supplies and above normal temperatures after May 10. A change toward dry clear weather which occurred about the time that the first crops were ready for cutting was favorable for haying and there was less than usual loss of quality. Later crops of alfalfa, second crop clover and all other late hay crops were adversely effected by drought.

The 1944 crop season was preceded by a rather dry fall and winter. Fall sown grains and other seedings generally went into the winter in better than average condition, although top growth was a little short. These crops had a covering of snow in most of the State during the coldest winter weather. The eight months preceding February, 1944 were all below normal in precipitation. January and February were mild months while other winter months were colder than normal. April was the third wettest of State-wide record (since 1890) and brought soil moisture supplies up to near normal over the State. Excessive rainfall, generally, in April and wet fields in early May, particularly in central and southern Illinois reduced oats acreage sown below earlier intentions. April flood loss to winter wheat acreage was heavy in southwestern Illinois. Freezing temperatures extending into the southern section during the first week of May caused some damage to fruit and truck crops. After May 12, field work was rushed with all possible speed, although showers often interrupted corn and soybean planting. Unusually warm weather featured the last 3 weeks of May. Corn and soybeans germinated quickly. Early June was very favorable for field work and corn planting was largely completed by the 10th and soybeans by June 24th. June was the fourth warmest since 1890. Excepting flood damage, early season weather was very favorable for winter wheat and the crop made generally good growth. Dry weather beginning about the first of June checked the expected damage from rust and a good wheat yield was realized. Early hay yields were very good.

After 4 months with above normal precipitation for the State, marked deficiencies occurred in June, July and the first half of August. Over much of the central and southern part of the State the drought lasted for about 10 weeks and resulted in severe damage to corn, oats and late summer hay crops, also to soybean yields in many southern and lower central counties. Damage to corn was intensified by the worst chinch bug damage since the mid-thirties. While the season was marked by sharply varying rainfall, drought damage lessened northward and westward in the State. The more favored rainfall and better crop areas were the northwestern and west central districts, also in the western part of the southwestern and most of the east central districts. There were two dry periods in the north half of the State—the first beginning around June 20 and lasting until about July 26 and the second including the first half of August. Rains beginning about mid-August resulted in breaking the drought in nearly all parts of the State by the end of the month. Corn and soybeans were materially aided by the rains, which also revived pastures, late gardens, truck crops, and legume seedings. September was a favorable month for plant growth and tended to be increasingly rainy. Maturity of corn and soybeans was retarded. October 6 to 31 was without measurable rainfall and was ideal for maturing corn and soybeans. Conditions were perfect for combining soybeans. These crops were largely made ahead of killing frosts. Damp November weather slowed the drying and picking of corn but the crop was largely secured by December 1.

1944.....	19,883,300	19,883,300					804,777,000	

1 Per 100 lbs. of ear corn.

2 Pounds.

3 Price and value as of December 1.

4 Per cwt.

5 Estimates of the commercial crop refer to the production of apples in the following 26 commercial counties: Rock and Henderson, Adams, Pike, Scott, Calhoun, Greene, Jersey, Macoupin, Montgomery, Marion, Clay, Richland, Shington, Jefferson, Randolph, Perry, Franklin, Jackson, Williamson, Saline, Union, Johnson, Pope, Pulaski, and ssac. Estimates include fruit production for sale to commercial processors as well as for sale for fresh consumption.

6 Includes quantities unharvested due to market conditions as follows: Apples-1937-150,000; 1939-300,000; Peaches-1-168,000 bushels.

7 Cents per pound.

8 The average value per acre of all crops excluding fruits listed in the above Illinois Crop Summary Table is: 4-114.51; 1935-116.67; 1936-119.79; 1937-118.73; 1938-115.04; 1939-118.76; 1940-119.16; 1941-128.44; 1942-133.78; 1943-139.63; 4-139.84.

NOTE—See historical tables 40 to 105 for data relating to years preceding 1935.

Table 2--PRODUCTION AND DISPOSITION OF PRINCIPAL CROPS PRODUCED IN ILLINOIS, 1942-1944

		Unit	Production	Disposition			Value	
				Used on farm where grown		Sold	Household consumption	Sales
				Feed and seed	In farm household			
			Thousand units	Thousand units	Thousand units	Thousand units	Thousand dollars	Thousand dollars
Corn.....	1942 crop	Bushel	416,934	268,188	35	148,711	32	133,841

# CORRECTIONS

The following corrections should be made in the prices of Illinois farm products listed in the publication "Circular 444 -- Illinois Agricultural Statistics." Season average prices for 1944 crops as given in Circular 444 are all preliminary.

	From	To	Change
<u>Corn:</u>			
Season average price 1938 crop table 1 p. 20	\$ .46	\$.45	
Season average price 1938 crop table 177 p. 206	.46	.45	
<u>Soybeans:</u>			
Season average price 1937 crop table 1 p. 22	.81	.80	
Season average price 1937 crop table 183 p. 209	.81	.80	
<u>All Hay, loose:</u>			
Season average price 1939 crop table 187 p.	211	6.40	6.50
Season average price 1940 crop table 187 p.	211	7.30	7.40
Season average price 1943 crop table 187 p.	211	18.30	18.20

## LIVESTOCK ON ILLINOIS FARMS, JANUARY 1, 1945

---

The upward trend in Illinois livestock numbers that had continued for several years was halted during 1944. Numbers of horses, mules, hogs and sheep on farms had declined sharply by January 1, 1945 after reaching peak record levels a year earlier. Cattle numbers remained unchanged at 3,244,000 head, the largest of record.

The inventory value of all livestock on Illinois farms January 1 totaled \$423,329,000 compared with \$467,285,000 a year earlier. The decrease of about 9 percent reflects not only reduced numbers, but also decreases in the value per head for all species except hogs.

There was a gradual increase in numbers of all cattle and calves from 2,620,000 head in 1937 to the peak total of 3,244,000 head on January 1, 1944. There was no change in numbers of all cattle and calves during 1944. Milk cows increased 1 percent during 1944 to stand at 1,192,000 head, but the number of heifers and calves being saved for milk cows decreased 4 percent. Beef animals registered only minor changes. Values of cattle and calves averaged \$78.80 per head for a total of \$255,471,000 compared with \$80.50 and a \$261,141,000 total a year earlier. Milk cows averaged \$110.00 per head against \$113.00 on January 1, 1944, with total valuation declining to \$131,120,000 from the \$133,340,000 reached the previous year.

Hog numbers declined 25 percent to stand at 5,709,000 head on January 1, 1945 after having increased steadily from 5,232,000 head in 1941 to the record total of 7,612,000 in 1944. The sharp reduction of 903,000 head during 1944 reflects the heavy slaughter of hogs and a 22 percent reduction in the 1944 pig crop. Total inventory value January 1 was \$134,511,000 compared with \$158,134,000 last year, and value per head, \$23.60 and \$22.80 respectively.

Number of sheep and lambs on farms at 754,000 head, showed a reduction of 7 percent from the January 1, 1944 total of 807,000 head. The totals included 218,000 head on feed for market on January 1 of both years. At \$10.10 per head all sheep and lambs were valued at \$7,639,000 compared with \$10.70 and \$8,598,000 on the first of the preceding year.

The number of horses on farms at 380,000 head was down 9 percent and the number of mules at 48,000 head was down 11 percent from January 1, 1944 inventory totals. Numbers of horses on farms were only a fourth of the 1913 peak-year total of 1,522,000 head. Prices of work stock experienced a sharp downward tumble during 1944. Total inventory values of horses and mules were \$21,923,000 and \$3,785,000, respectively.

## ILLINOIS DAIRY STATISTICS

Illinois ranked fifth in milk production among the States in 1943. The presence of Chicago and St. Louis and a number of other large metropolitan areas makes the production of milk for fluid consumption a highly important segment of Illinois agriculture. The production of milk for manufacture is also highly important and Illinois is among the top States in the manufacture of butter, cheese, and evaporated whole milk—is second only to Wisconsin in the production of American cheese. The rapid growth in the volume of American cheese manufactured (it has increased 6 to 7 fold during the past decade) and the expanding area of production, from northwestern Illinois Southward, have been interesting developments of recent years.

Table 135—MILK: Production and farm disposition, Illinois, 1924-44

Year	Number of milk cows on farms <sup>1</sup>	Production per milk cow <sup>2</sup>		Per-centage of butterfat in milk	Total production on farms <sup>2</sup>		Butter churned on farms	
		Milk	Butterfat		Milk	Butterfat	Milk used	Butter made

<sup>1</sup> Computed from the value of milk, cream and farm butter sold divided by the quantity of milk or butterfat used in the preparation of these products for market.

<sup>2</sup> Computed as difference between cash income and gross income from dairy products.

<sup>3</sup> Milk utilized for products sold and for products consumed in the farm household valued at average returns for milk utilized in products sold.

## ILLINOIS POULTRY STATISTICS

Illinois ranked fifth among the States in number of chickens on farms January 1, 1945, and sixth in egg production during 1944. Egg production is relatively more important than the production of chickens—cash income from the sale of eggs during 1944 (62 million dollars) was almost double that from the sale of chickens. A poultry enterprise is common to most Illinois farms. On the average, only one farm in twenty does not have chickens.

Table 152—CHICKENS: Number on farms January 1, and value, Illinois, 1924-45

Year	All chickens			Hens and pullets, number on farms	Other chickens, number on farms

## WEATHER SUMMARY FOR ILLINOIS, 1939-44

---

NOTE: The following Illinois weather summaries have been briefed from the annual issues of "Illinois Climatological Data" published by the Illinois Section of the United States Weather Bureau (Mr. E. W. Holcomb, in charge), Springfield, Illinois.

### 1939

The year 1939 was outstanding for the record autumn drought, the unusually warm months of January, September and December—third, fourth, and sixth warmest respectively in the past 50 years—and for one of the warmer Mays and one of the wetter Augusts of record. Monthly temperatures averaged above normal except in April, August and November. The winter months were comparatively mild (January averaging 6.6 degrees above normal), and zero temperatures were of infrequent occurrence. The summer was characterized by moderate temperatures, June averaging slightly above normal, July and August comparatively cool. Maxima of 100 degrees or higher occurred on three days in July and seven days in September; it was only the second time in the last 50 years that 100 degree readings have been recorded in the latter month. The last killing frost of spring occurred about May 3rd in the north portion of the State, and about April 12th to 13th in the central and south portions. The first killing frost of autumn occurred over part of the north and central portions on October 1st, in the remainder of those divisions on October 14th, and over the south portion generally on October 14th to 15th.

Sunshine was somewhat to considerably above the normal generally in March, May, September, October and December, and deficient in February, April and over most of the State in November.

Although precipitation averaged only 0.80 inch below normal for the year as a whole, there occurred the most severe autumn drought of record, exceeding in intensity all previous September to November periods in the past half century. Precipitation was above normal in all but one of the first eight months, May rainfall being sub-normal. Annual distribution varied from more than 10 inches below normal in areas of the extreme north to lesser deficiencies over much of the north, west central and southeast; above normal amounts occurred from east central counties southwestward over the south central and the extreme southwest. Positive departures of more than an inch occurred in February, April, June and August, the last mentioned being one of the wettest Augusts in the past 50 years. In contrast September was the driest for that month, and September to November precipitation the least of record since 1890. The drought which had its inception in late August persisted through December, and the four months—September to December inclusive—were the driest for a similar period in the fifty years of record, averaging but 49 percent of normal, compared with 119 percent of normal for the first eight months of the year. Snowfall averaged above normal for the three winter months and the January total was the fourth heaviest in the past 26 years.

Damage from wind, hail, and lightning during the year was about average. There were three tornadoes in June and one in August, with combined property and crop losses of approximately 175 thousand dollars and injury to twelve persons.

### 1940

This was the fourth driest year in the 51 years of State-wide records. This year's average exceeded the dry year of 1901 by 2.53 inches, that of 1914 by 0.30 inch, and that of 1930 by 1.03 inches. The dryness that char-

acterized 1940 began with the closing days of August 1939. Comparing the 16-months' period ending with December 31, 1940, with the same period ending with the three previously mentioned especially dry years, it is found that the current 16-months' period is 0.50 inch less than any of the other three periods. Precipitation exceeded normal only in April, August, and November, and in those months by relatively small amounts. Deficiencies in March and July exceeded an inch, and in September amounted to three inches. Precipitation for the central division averaged slightly less than for the northern division, whereas, normally, it exceeds the northern division by more than three inches. Snowfall for the year was 1.7 inches less than normal. January snowfall averaged the tenth heaviest for that month, and February averaged slightly above normal. During the remaining winter months snowfall was decidedly sub-normal. An outstanding result of the prolonged precipitation deficiency was dry wells and failure otherwise of water sources in numerous localities, necessitating hauling of water considerable distances in some instances.

The year began with the coldest January of the 51 years of record; March, April, May, September, and November also averaged cold, particularly March and May. Contrastingly, February, June to August, October, and December averaged above normal. From about the 19th of July and extending to about August 5, maxima generally rose to above 90° daily, and many stations in all parts of the State from about the 24th of July on recorded temperatures above 100°, some on five or six successive days.

Last killing frost of spring generally occurred on April 14 in the south and extreme west-central portions of the State, and mostly on May 4 elsewhere. First killing frost in autumn came on November 7, except in the extreme north-central and extreme northwest, where it occurred on October 16. Generally, this made a growing season of approximately 187 to 207 days.

#### 1941

This was one of the five warmest years of Illinois climatological history; only 1921, 1931, 1933, and 1938 averaged warmer in the 52 years of record. Monthly means were above normal in all months excepting February and March. March was unseasonably cold, averaging 4° below normal, with sub-zero temperatures being registered during the month at a few scattered northern stations.

The year's precipitation for the State was approximately 8% above normal despite persistence of drought conditions through March, which month was the fourth driest March of record. In sharp contrast October was the wettest for that month in Illinois climatological while September and October combined were the wettest two months of State-wide record. Outstanding individual monthly totals for October included 16.56 inches at Galesburg, 14.75 inches at Monmouth, and 14.63 inches at Waverly, and numerous stations had monthly amounts ranging between 10 and 13 inches. Annual snowfall averaged approximately three inches below the normal; January and March snowfall approximated the normal while that for November averaged somewhat above.

The last killing frost of spring generally occurred on April 25th in the northern third of the State and on March 29th in the central and south. The first killing frost in autumn occurred about October 29th. Generally this made a growing season of approximately 187 days in the northern portion and 214 days in the central and south.

#### 1942

This year was one of the ten wettest in Illinois climatological history, covering 53 years of State-wide record; in the central division it was one of the seven wettest. Precipitation exceeding the normal in two of the three winter months, February being one of the four wettest of record for that month. March and April precipitation combined averaged slightly more than an inch below normal, followed by well-distributed rains during May; rainfall for the four months May to August, inclusive, exceeded 18 inches for the State, comparable to the wet May-August periods of 1935, 1938, and the six earlier wet seasons of 1892, 1896, 1902, 1907, 1915, and 1924. Sep-

tember and October precipitation averaged somewhat below normal, October being one of the five driest for that month in 34 years; in contrast, November precipitation was particularly heavy, exceeded for that month only in 1934 in 53 years of record. Annual snowfall averaged about one inch above normal; nearly seven inches occurred in February and eight inches in December, the latter month being nearly twice the normal. Flooding of lowlands occurred in connection with the heavy precipitation of February in the Illinois watershed, when all-time 24-hour precipitation for the cold months was registered at several stations, covering periods of 60 to 83 years of record. In July 24-hour amounts of 6 to 8 inches occurred in localities of the southwest and south-central portions and flooded lowlands. At East St. Louis 8.48 inches occurred in  $9\frac{1}{2}$  hours on the 9th.

Annual temperature for the State averaged slightly above normal. January, May, June, July, and October averaged approximately normal, while February, August, September, and December were below normal. In contrast, March, April and November were unseasonably warm.

The last killing frost of spring generally occurred about April 20 in the north and central portions and April 11-12 in the south; the first killing frost in the fall occurred on September 24-25 in the extreme north and generally over the State on September 28 except somewhat later in localities of the South. The comparatively early autumn frosts—about two to four weeks in advance of the average date—resulted in a shortened growing season of approximately 156 days in the extreme north and 168 days in the central and most of the south.

#### 1943

Temperature this year averaged only  $0.4^{\circ}$  below normal for the State—a warmer than normal January-February and warm summer offsetting a cool spring and fall and cold December. Annual precipitation was about five percent below normal, monthly totals for the State exceeding normal only in April and May. The outstanding event of the year was the heavy May rainfall, which was the most in 54 years of State-wide record. Heavy showers began during the last ten days of April and continued at frequent intervals through the greater part of May, exceeding an inch at many stations on five or six days; this concentration of heavy rain and the saturated condition of the soil resulted in maximum run-off and ensuing floods in the Illinois, Mississippi, Wabash, Sangamon, and Kaskaskia rivers and their tributaries, which in many instances reached the highest levels of record. A considerable area of farm land was inundated, and a sizeable acreage of small grain ruined. In early August, record 24-hour rains occurred at a number of stations in the north-central part of the State, short-period totals exceeding six inches at several stations. State precipitation for August averaged somewhat below normal, however, and the succeeding four months considerably so, totaling but 53% of normal in the northern division compared with 71% to 80% in the central and southern divisions. The augmenting drought conditions slowed growth of winter crops, lowered farm-water reserves, and delayed fall plowing in many localities. Annual snowfall averaged over an inch below normal for the State; quite heavy amounts occurred in the extreme north in January, and monthly averages for the State were above normal in that month and March and December, but were considerably below normal in February and November.

The last killing frost of spring occurred on May 1 in parts of the north and east-central and on April 15 or 21 elsewhere over the State; the first killing frost of fall occurred generally on October 17. The length of the growing season varied from approximately 169 days in the north to 179 to 185 days in the central and south.

#### 1944

The two outstanding events of 1944 weather in Illinois were the heavy spring rains and resultant April floods in the Illinois, Mississippi, Wabash, Sangamon, and Kaskaskia River valleys, and the severe summer drought over most of the central and southern portions of the State.

Temperature averaged well above normal in both January and February, though in mid-February some severely cold weather occurred and the February snowfall was quite heavy. March and April were cold and wet—April precipitation for the State averaging the third heaviest of April record; the concentration of heavy showers between the 10th and 23rd of the month resulted in the overflow of rivers and small streams in the State, flooding approximately a quarter million acres of farm land and destroying thousands of acres of small grain. Further heavy rains in May in the Upper Mississippi Valley produced the highest river stage ever recorded at Quincy and flooded considerable farm acreage in Adams and Hancock counties.

May and June were the fourth warmest for those months in 55 years of record. June was the all-time driest at a number of stations in the central and southern divisions of the State and marked the beginning of the prolonged summer drought in those areas where precipitation in a number of localities totaled less than 25 percent of normal for the period from June 1 to August 15. Substantial rains during the latter part of August brought needed relief to most of the drought area. Further beneficial showers occurred during September, particularly in the central portion. October, November, and December precipitation was subnormal, however, October experiencing one the longest dry periods without measurable rain in the records of many stations. The persistent dryness until the end of the year in many localities of the southeast and extreme south resulted in accumulated moisture deficiencies for the year of 10 to more than 16 inches at a number of stations in those areas.

The last killing frost of spring occurred on May 5th or 6th in most localities of the north and central and on April 5th to 6th or May 7th in the south; the first killing frost of fall occurred quite generally about October 12th in northern Illinois and on October 16th to 17th or November 24th over most localities of the southern half. In general the length of the growing season in the north and central varied from 158 to 184 days and in the southern division from 158 to 197 days, though in a number of localities in the west central and extreme south the length of the season ranged from 200 to 233 days.

Sunshine averaged near normal to considerably above in most sections of the State in January, February, and June through October, but largely below normal in March through May and in November and December. November was the cloudiest in 55 years of State-wide record, and monthly sunshine generally amounted to only 15 to 30 percent of normal.

Estimated storm damage from wind, hail, and lightning during the year exceeded 2.5 million dollars. A tornado on June 22, originating in southern Wisconsin, moved southeastward into Stephenson County along a path of about one mile in width for a distance of approximately 18 miles. It resulted in the destruction of 21 farm homes and varying damage to 45 others; in addition more than 4,000 acres of standing crops were destroyed.

Table 220—MISCELLANEOUS ILLINOIS DATA FROM THE FEDERAL CENSUS OF AGRICULTURE, 1930 AND 1940

Item	Number	Percent
Approximate land area, acres.....	35,806,080	-----
Land in farms, acres and percent of total land area, 1940.....	31,032,572	86.7
Land used for crops, acres and percent of land in farms, 1939.....	18,479,324	59.6
Crop land idle, acres and percent of land in farms, 1939.....	1,718,459	5.5
Plowable pasture, acres and percent of land in farms, 1939.....	4,935,691	15.9
Other farm land, acres and percent of land in farms, 1939.....	5,899,098	19.0
Total population, 1940.....	7,897,241	-----
Total population, excluding Chicago Metropolitan district, 1940.....	3,669,647	-----
Total farm population, number persons and percent of total population, 1940.....	978,907	12.4
Total farm population, number persons and percent of total population, 1930.....	999,249	13.1
Number of farms, total and in percent of 1930 number, 1940.....	213,439	99.5
Number of farms under 10 acres, total and percent of all farms, 1940.....	12,738	6.0
Number of farms of 10 to 49 acres, total and percent of all farms, 1940.....	32,104	15.0
Number of farms of 50 to 99 acres, total and percent of all farms, 1940.....	38,291	17.9
Number of farms of 100 to 179 acres, total and percent of all farms, 1940.....	67,566	31.7
Number of farms of 180 to 259 acres, total and percent of all farms, 1940.....	35,614	16.7
Number of farms of 260 to 499 acres, total and percent of all farms, 1940.....	24,021	11.3
Number of farms of 500 to 999 acres, total and percent of all farms, 1940.....	2,839	1.3
Number of farms of 1,000 acres and over, total and percent of all farms, 1940..	266	0.1
Average size of farm, acres and percent of 1930 average, 1940.....	145.4	101.6
Farms operated by full owners, number and percent of all farms, 1940.....	87,004	40.7
Farms operated by part owners, number and percent of all farms, 1940.....	32,826	15.4
Farms operated by managers, number and percent of all farms, 1940.....	1,627	0.8
Farms operated by tenants, number and percent of all farms, 1940.....	91,982	43.1
Land in farms of full owners, acres and percent of all farm land, 1940.....	9,136,105	29.4
Land in farms of part owners, acres and percent of all farm land, 1940.....	6,564,667	21.2
Land owned by part owners, acres and percent of all farm land, 1940.....	3,292,268	10.6
Land rented by part owners, acres and percent of all farm land, 1940.....	3,272,399	10.6
Land in farms operated by managers, acres and percent of all farm land, 1940..	456,784	1.5
Land in farms operated by tenants, acres and percent of all farm land, 1940..	14,875,016	47.9
Number automobiles on farms, and percent of all farms reporting automob- iles, 1940.....	210,555	82.5
Number motor trucks on farms, and percent of all farms reporting motor trucks, 1940.....	42,515	18.7
Number tractors on farms, and percent of all farms reporting tractors, 1940..	126,069	51.8
Dwellings lighted by electricity, number farms reporting and percent of all farms, 1940.....	87,611	41.0
Farms reporting telephones, number and percent of all farms, 1940.....	105,683	49.5

Table 238.—SEEDING DATA FOR COMMON FIELD CROPS, ILLINOIS

Crop	Rate of seeding per acre		Time of seeding		Depth	Time of harvest
	Drilled	Rows	Fall	Spring		
Alfalfa.....	12-15 lbs.	Pounds	Aug. 1-15.....	Apr.-May.....	Harrow in	June 10-July 20-August 30
Barley.....	2 bu.		Aug. 1-15.....	Mar. 15-Apr. 1.....	1-3 in.	July
Bent grass.....	25 lbs.		Aug. 1-15.....	Late Spring.....	1-1 in.	When in full bloom
Bermuda grass.....	5 lbs.		Aug. 1-15.....		1-1 in.	When in full bloom
Blue grass—						
Canada.....	25 lbs.		Aug. 15-Sept. 1.....	Mar.-May.....	1-1 in.	June
Kentucky.....	25 lbs.		Aug. 15-Sept. 1.....	Mar.-May.....	1-1 in.	June 15
Rough-stalked meadow.....	20-25 lbs.		Aug. 15-Sept. 1.....	Mar.-May.....	1-1 in.	September 15
Brome grass.....	20 lbs.		Aug. 15-Sept. 1.....	Mar. 24-May 15.....	1-1 in.	August
Broomcorn.....		2-3	Aug. 15-Sept. 1.....	May 5-20.....	2 in.	August
Buckwheat.....	3-4 pecks			June 10-July 10.....	1-2 in.	September
Canada field pea.....	1 1/2-3 bu.			Mar. 20-Apr. 10.....	1 1/2-3 in.	June-July
Clover—						
Alsike.....	7-8 lbs.		July-Sept.....	Feb. 20-Apr. 10.....	1-1 in.	June, July
Crimson.....	15-20 lbs.		Aug. 15-Sept. 15.....		1 in.	April, May
Hop.....	6-8 lbs.		Aug. 15-Sept. 1.....	Feb. 15-Mar. 15.....	1-1 in.	June 20-July 10
Mammoth.....	8-10 lbs.		Aug. 1-Sept. 1.....	Feb., Apr.....	1-1 in.	June 20
Red.....	8-10 lbs.		Aug. 1-Sept. 1.....	Apr., June.....	1-1 in.	June 20
White.....	6-8 lbs.			May 1-30.....	2 in.	November
Corn.....	90-120 lbs.	6-10		Apr.-May.....	1 1/2-2 in.	July-September
Cowpeas.....	12-20 lbs.	30-60		Mar. 15-May 15.....	1-1 in.	June-July
Crested wheat grass.....	12-15 lbs.			Apr.....	1-1 in.	August-September
Dalea (Wood's clover).....						
Fescues—						
Chewing's.....	15-20 lbs.		Aug. 1-Sept. 1.....	Mar. 1-June 1.....	1 in.	June-July
Meadow.....	25-35 lbs.		Aug. 1-Sept. 1.....	Apr.-May.....	1 in.	June-July
Red.....	15-20 lbs.		Aug. 1-Sept. 1.....	Mar. 1-June 1.....	1 in.	June-July
Sheep.....	28 lbs.		Aug. 1-Sept. 1.....	Mar. 1-June 1.....	1 in.	June-July
Flax.....	30-40 lbs.			Apr. 1-15.....	1 in.	July
Hemp.....	3 pecks			Apr. 15-May 1.....	1-1 in.	August
Johnson grass.....	20-30 lbs.		Aug. 1-Sept. 1.....	Apr.-June.....	1-1 in.	When in full bloom
Lespedeza—						
Korean.....	10-20 lbs.			Mar.-Apr.....	1 in.	September
Sericea.....	15-30 lbs.			Feb.-Apr.....	1 in.	When in full bloom
Millet.....	30 lbs.			May 10-20.....	1 in.	July
Oats.....	2 bu.			Mar. 20-Apr. 10.....	1 in.	July
Oatgrass, tall.....	30 lbs.		Aug. 15.....	Mar., Apr.....	1-1 1/2 in.	When in full bloom
Orchard grass.....	20 lbs.		Aug. 1-Sept. 1.....	Mar. 10-June 1.....	1-2 1/2 in.	Before full bloom
Peanuts.....	32-48 lbs.			May 10-June 1.....	1-2 1/2 in.	September
Rape.....	3-5 lbs.			Apr. 1-Aug. 15.....	1-1 in.	October-November

Redtop.....	15-20 lbs.	July 15-Sept. 10	Mar. 1-June 1	$\frac{1}{4}$ in.	When in full bloom
Reed canary grass.....	20-25 lbs.	Aug. 1-Sept. 1	Mar. 1-Apr. 15	$\frac{1}{4}$ in.	When in full bloom
Rye—					
Spring.....	60-90 lbs.		Mar.-May	$\frac{1}{2}$ in.	July
Winter.....	60-75 lbs.	Sept., Nov.	Apr.-May	$\frac{1}{2}$ in.	July
Rye grass.....	25-30 lbs.			$\frac{1}{4}$ in.	When in full bloom
Sorghum—					
Grain.....	60 lbs.	6-8	May, June	$\frac{1}{4}$ in.	September
Sweet.....	60-80 lbs.	6-8	May, June	$\frac{1}{4}$ in.	September
Soybeans.....	90-130 lbs.	50-70	May 10-20	$\frac{1}{2}$ in.	September
Sudan grass.....	20 lbs.	3-5	May 10-20	$\frac{1}{4}$ in.	When in full bloom
Sugar beets.....		18-20	Apr. 1-May 1		
Sunflower.....	8-10 lbs.	3-6	May 10-20	1 in.	August, September
Sweet clover.....					
Bien, white.....	12-15 lbs.	Aug. 1-15	Apr.-May	$\frac{1}{4}$ in.	August, October
Bien, yellow.....	12-15 lbs.	Aug. 1-15	Apr.-May	$\frac{1}{4}$ in.	August, October
Hulled.....	12-15 lbs.		Mar. 1-15	$\frac{1}{4}$ in.	August, October
Unhulled.....	30 lbs.		Feb. 15-Mar. 1	$\frac{1}{4}$ in.	August, October
Timothy.....	12-15 lbs.	Aug. 15-Oct. 1	Mar.-Apr.	$\frac{1}{4}$ in.	June, July
Wheat—					
Spring.....	2 bu.	Sept. 20-Oct. 10	Mar. 1-10	1-3 in.	July
Winter.....	6 pecks	Sept. 10-Oct. 10	Mar. 20-Apr. 10	1-3 in.	July
Winter vetch.....	40 lbs.	Aug. 15-Sept. 15		$\frac{1}{2}$ in.	May, June
Yellow trefoil.....	15 lbs.			$\frac{1}{4}$ in.	

NOTE—Prepared by the late J. J. Pieper, Department of Agronomy, University of Illinois College of Agriculture, Urbana, Illinois.

Table 239—TIME OF PLANTING: Percent of acreage of specified crops usually planted each month in Illinois

Crops	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.

<sup>1</sup> Not included in animal units on farms.

<sup>2</sup> In order to show the total change in all livestock numbers as a single group, as related to the feeds used by the various species, different animal units have been devised and the estimated numbers on farms Jan. 1 have been converted to these units which are intended to allow for differences in size and feed requirements of the several species. The weighting used in computing the animal units shown in this table has been varied somewhat over the entire period in order to make allowance for changes in feeding and marketing practices. In recent years the weighting per

animal has been as follows:

A=Representing feed-grain-consuming animals, excluding chickens—milk cows, 1; other cattle, 0.51; hogs, 0.87; sheep, 0.04; horses and mules, 1.14.  
 B=Representing hay-, forage-, and pasture consuming animals—milk cows, 1; other cattle, 0.75; sheep, 0.12; horses and mules, 1.  
 C=Jan. 1 combination based largely on relative weight.  
 D=Total, feed-grain-consuming animals, including chickens—chickens added to A, assuming 4.5 units per 100 chickens.

<sup>1</sup> Standard bushel used in the United States contains 2,150.42 cubic inches; the gallon, 231 cubic inches, the cranberry barrel, 5,826 cubic inches, and the standard fruit and vegetable barrel, 7,056 cubic inches. Such large-sized products as apples and potatoes sometimes are sold on the basis of a heaped bushel, which would exceed somewhat the 2,150.42 cubic inches of a bushel basket level full. This also applies to such products as sweet potatoes, peaches, green beans, green peas, spinach, etc.

<sup>2</sup> Approximate inside dimensions, 10½ by 11½ by 18 inches.

<sup>3</sup> Approximate inside dimensions, 4½ by 16 by 16 1/8 inches.

<sup>4</sup> Approximate inside dimensions, 9½ by 11 by 20 5/8 inches.

<sup>5</sup> Approximate inside dimensions, 3½ by 13½ by 16 1/8 inches.

<sup>6</sup> Approximate inside dimensions, 4 3/16 by 13½ by 16 1/8 inches.

<sup>7</sup> Approximate inside dimensions, 13 by 18 by 21 5/8 inches.

<sup>8</sup> Approximate inside dimensions, 12 by 12 by 22 1/8 inches.

<sup>9</sup> This is the weight commonly used in trade practice, the actual weight varying according to temperature conditions.

<sup>10</sup> Approximate inside dimensions, 22 by 16 by 20½ inches.

<sup>11</sup> Approximate inside dimensions, 3½ by 11½ by 14 1/8 inches.

<sup>12</sup> The standard weight of 70 pounds is usually recognized as being about 2 measured bushels of corn, husked, on the ear, because it required 70 pounds to yield 1 bushel, or 56 pounds of shelled corn.

<sup>13</sup> For statistical purposes the bale of cotton is 500 pounds gross or 478 pounds net weight. Actual bale weights vary considerably, and the customary average weights of bales of foreign cotton differ from that of the American square bale.

<sup>14</sup> This is the average weight of cottonseed, although the legal weight in some states varies from this figure of 32 pounds.

<sup>15</sup> Approximate inside dimensions, 9½ by 10½ by 15 inches.

<sup>16</sup> Approximate inside dimensions, 1½ by 11 by 16 1/8 inches.

<sup>17</sup> Approximate inside dimensions, 12 by 12 by 24 inches.

<sup>18</sup> Approximate inside dimensions, 11½ by 11½ by 24 inches.

<sup>19</sup> Approximate inside dimensions, 5½ by 13½ by 16 1/8 inches.

<sup>20</sup> Approximate inside dimensions, 4½ by 16 by 16 1/8 inches.

<sup>21</sup> About 13 pounds of sawdust are required to pack 32 pounds of grapes in a keg, thus making the total weight about 45 pounds.

<sup>22</sup> Approximate inside dimensions, 7½ by 15 by 18½ inches.

<sup>23</sup> Approximate inside dimensions, 10 by 13 by 25 inches.

<sup>24</sup> Approximate inside dimensions, 8½ by 11½ by 18 inches.

<sup>25</sup> Approximate inside dimensions, 12 by 10½ by 33 inches.

<sup>26</sup> Approximate inside dimensions, 3½ by 11 by 18 inches.

<sup>27</sup> This average of 55 pounds indicates the usual weight of sweet potatoes when harvested. Much weight is lost in curing or drying, and the net weight when sold in terminal markets may be far below 55 pounds.

<sup>28</sup> Approximate inside dimensions, 6 by 12 by 24 inches.

Table 256—WEIGHTS, MEASURES, AND CONVERSION FACTORS USED IN THE UNITED STATES DEPARTMENT OF AGRICULTURE—Continued  
(Other conversion factors)

Commodity.	Unit	Approximate equivalent
Apples.....	1 pound dried.....	7 pounds fresh.
do.....	1 pound chops.....	5 pounds fresh.
do.....	1 barrel.....	3 boxes or 3 bushel baskets.
Apricots.....	1 pound dried.....	5½ pounds fresh.
Barley flour.....	1 barrel (196 pounds).....	9 bushels barley.
Beans, lima.....	1 pound shelled.....	2 pounds unshelled.
Buckwheat flour.....	1 barrel (196 pounds).....	7 bushels buckwheat.
Cane sirup.....	1 gallon.....	5 pounds sugar.
Cherries.....	1 pound dried.....	4 pounds fresh in California; 5 pounds fresh elsewhere.
Corn, shelled.....	1 bushel (56 pounds).....	2 bushels (70 pounds) of husked ear corn.
Corn meal:		
Degermed.....	1 barrel (196 pounds).....	6 bushels corn.
Nondegermed.....	do.....	4 bushels corn.
Cotton.....	1 pound ginned.....	2.86 pounds unginned.
Dairy products:		
Butter.....	1 pound.....	21 pounds milk.
Cheese.....	do.....	10 pounds milk.
Condensed milk, whole.....	do.....	2.2 pounds milk.
Evaporated milk, whole.....	do.....	2.2 pounds milk.
Ice cream <sup>29</sup> .....	1 gallon.....	15 pounds milk.
Ice cream <sup>29</sup> (eliminating fat from butter and concentrated milk).....	do.....	12 pounds milk.
Malted milk.....	1 pound.....	2.6 pounds milk.
Powdered milk.....	do.....	8 pounds milk.
Powdered cream.....	do.....	19 pounds milk.
Dates.....	1 pound (dried).....	1 1/3 pounds fresh.
Eggs.....	1 case (45 pounds).....	35.3 pounds frozen or liquid eggs.
Figs.....	1 pound dried.....	3 pounds fresh in California; 4 pounds fresh elsewhere.
Grapefruit, Florida.....	1 case canned.....	Slightly less than 1 box fresh fruit.
Flaxseed.....	1 bushel.....	Yields about 2½ gallons oil.
Linseed oil.....	1 gallon.....	From 0.4 bushel flaxseed.
Malt.....	1.1 bushels.....	1 bushel barley.
Maple sirup.....	1 gallon.....	8 pounds sugar.
Nuts:		
Almonds, imported.....	1 pound shelled.....	3 1/3 pounds unshelled.
Almonds, California.....	do.....	2.22 pounds unshelled.
Brazil.....	do.....	2 pounds unshelled.
Cashews.....	do.....	4.55 pounds unshelled.
Chestnuts.....	do.....	1.19 pounds unshelled.
Filberts.....	do.....	2.22 pounds unshelled.
Pecans:		
Seedling.....	do.....	2.63 pounds unshelled.
Improved.....	do.....	2.38 pounds unshelled.
Pignolias.....	do.....	1.30 pounds unshelled.
Pistachios.....	do.....	2 pounds unshelled.
Walnuts:		
Black.....	do.....	8 1/3 pounds unshelled.
Persian (English).....	do.....	2.38 pounds unshelled.
Oatmeal.....	1 barrel (196 pounds).....	10 8/9 bushels oats.
Peaches, California.....	1 pound dried.....	5½ pounds fresh.
Peanuts.....	1 pound shelled.....	1½ pounds unshelled.
Pears.....	1 pound dried.....	5½ pounds fresh.
Peas, green.....	1 pound shelled.....	2.5 pounds unshelled.
Prunes.....	1 pound dried.....	2½ pounds fresh in California; 3 to 4 pounds fresh elsewhere.
Raisins.....	1 pound.....	4 pounds fresh grapes.
Rice.....	1 pound milled.....	1.62 pounds rough or unhulled rice.
Rye flour.....	1 barrel (196 pounds).....	6 bushels rye.
Sugar.....	1 ton raw.....	Hawaii, 0.9617 ton refined; Puerto Rico and Philippines, 0.946 ton refined; Cuba, 0.9418 ton refined, beginning with the 1931-32 season; Louisiana (96° raw), 0.9346 ton refined, beginning 1919; Florida (96° raw), 0.9346 ton refined, beginning 1928.
Tobacco.....	1 pound stemmed.....	Various weights of unstemmed, according to the type of tobacco. (See Circular 435, U. S. Dept. of Agriculture.)
Wheat flour.....	1 barrel (196 pounds).....	4.7 bushels wheat. <sup>30</sup>
Wool.....	1 pound scoured.....	2 pounds grease.
do.....	1 pound pulled.....	1 1/3 pounds grease.

<sup>29</sup> The milk equivalent of ice cream per gallon is 15 pounds. Reports from plants indicate about 81 percent of the butterfat in ice cream is from milk and cream, the remainder being from butter and concentrated milk. Thus the milk equivalent of the milk and cream in a gallon of ice cream is about 12 pounds.

<sup>30</sup> This figure (4.7) has been used for conversions relating to the period 1921-39. Because of changes in milling processes, the following factors have been used for earlier periods: 1790-1879, 5 bushels; 1880-1908, 4.75 bushels; 1909-17, 4.7 bushels; 1918 and 1919, 4.5 bushels; 1920, 4.6 bushels.

## TABLE OF CONTENTS

---

	PAGE
FOREWORD .....	5
CHARACTERISTICS OF ILLINOIS—MAPS.....	6
Counties and crop reporting districts; General soil types; Types of farming; Climate.	
CROPS .....	13
Acreage; yield per acre; production; crop year prices; value of production; farm disposition of crops; monthly sales; farm practices; grain stocks.	
Field crops .....	15
Truck crops .....	60
Fruit crops .....	71
LIVESTOCK, DAIRY, AND POULTRY.....	79
Numbers, prices, and value of January 1 inventories; Number of cattle and sheep on feed; Farm production and income; Inshipments and marketings; Dairy manufactures; Hatchery production.	
Livestock .....	81
Dairy .....	100
Poultry .....	109
PRICES RECEIVED BY FARMERS.....	117
Index numbers by groups of farm commodities and for all farm commodities; Estimated midmonth prices; Hog-corn ratios.	
MISCELLANEOUS .....	151
Income from sale of farm commodities; Number of farms and land in farms; Numbers of automobiles, trucks, and tractors on farms; Farm land values; Honey production; Farm wage rates.	
INDEX .....	159

## FOREWORD

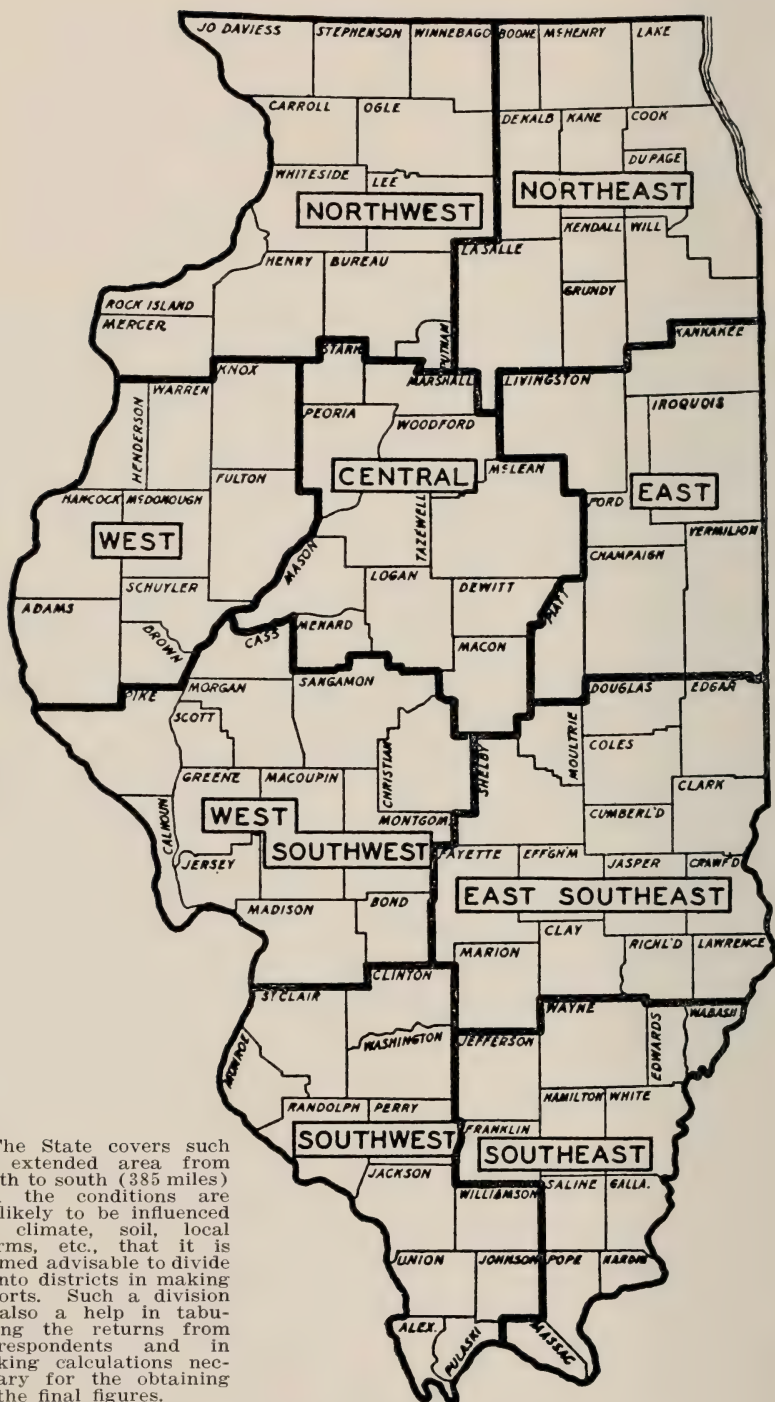

---

This publication is Circular 445 in the Illinois Agricultural Statistics series compiled by the Illinois Cooperative Crop Reporting Service of the Illinois Department of Agriculture and the United States Department of Agriculture. The series was originated by the late A. J. Surratt, Agricultural Statistician for Illinois from 1922 to 1948. All circulars except the present Circular 445 were compiled under his direction. Assembled in this circular are all of the State series of Illinois Agricultural Statistics from the beginning of the various records through 1944. Statistics for years since 1944 are subject to revision and therefore have been omitted. Some time during the next year it is planned to assemble in another publication the various series of Illinois county estimates for a comparable period.

Present plans are that as revisions are made in the estimates for recent years, supplements to this publication as well as to the forthcoming one on county estimates will be issued at five year intervals. In the meantime the more important series of State and county estimates for the years since 1944 will be summarized in the multilithed publication usually released early in the spring of each year. Current estimates of crops, livestock, and farm prices are released in the monthly reports of the crop reporting service.

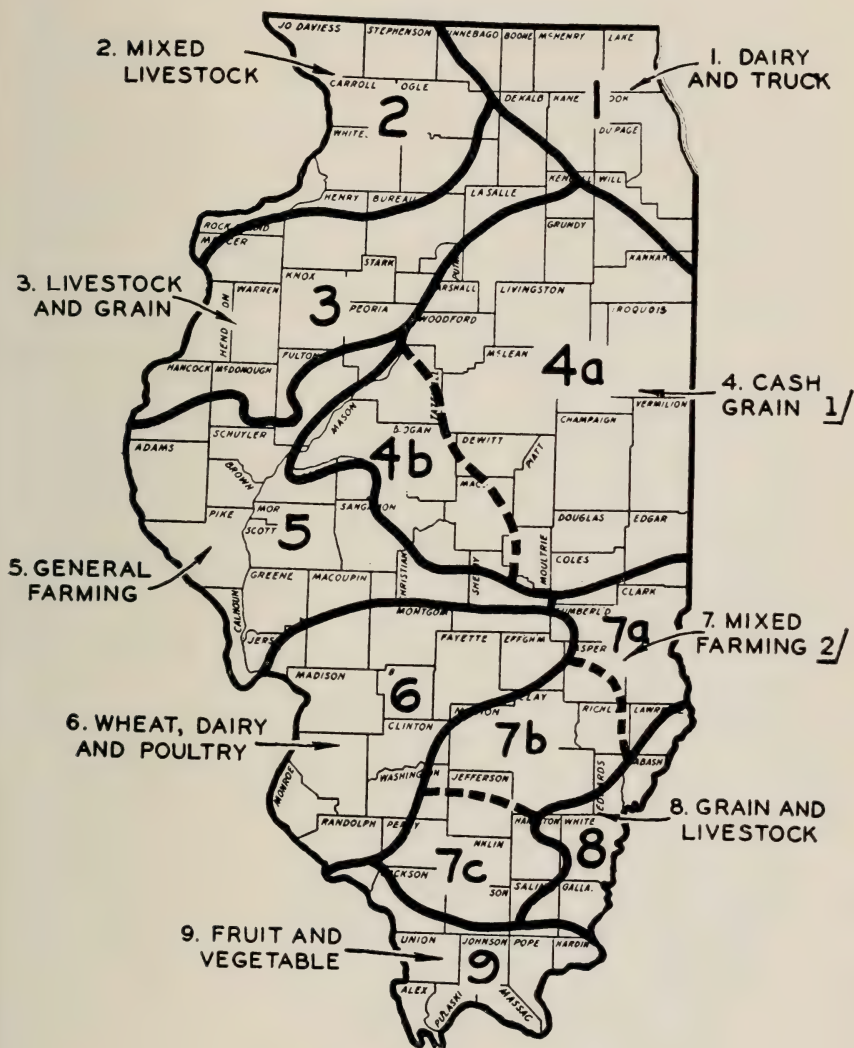

The contents of this publication are made possible by the voluntary cooperation of thousands of farmers, merchants, professional people, and processors and handlers of agricultural commodities who at regular intervals have contributed their knowledge based on observations and records. The Illinois Assessors' Census of Agriculture made every year and the Federal Census of Agriculture made every five years provide complete enumerations which assure accuracy in current sample estimates for the State and counties. Reports of the Federal Census of Agriculture also include certain data of sociologic and economic significance to agriculture which are not shown here. These ordinarily are available in all public libraries. Agricultural statistics for other States and the United States are contained in the publication Agricultural Statistics, issued annually by the United States Department of Agriculture in Washington, D. C.

## OUTLINE MAP OF ILLINOIS

The State covers such an extended area from north to south (385 miles) and the conditions are so likely to be influenced by climate, soil, local storms, etc., that it is deemed advisable to divide it into districts in making reports. Such a division is also a help in tabulating the returns from correspondents and in making calculations necessary for the obtaining of the final figures.

# THE NINE MAJOR TYPE-OF-FARMING AREAS IN ILLINOIS

<sup>1</sup> (a) Corn and oats. (b) Corn and wheat.

<sup>2</sup> (a) General farming. (b) Redtop, fruit, and poultry. (c) General and part-time farming.

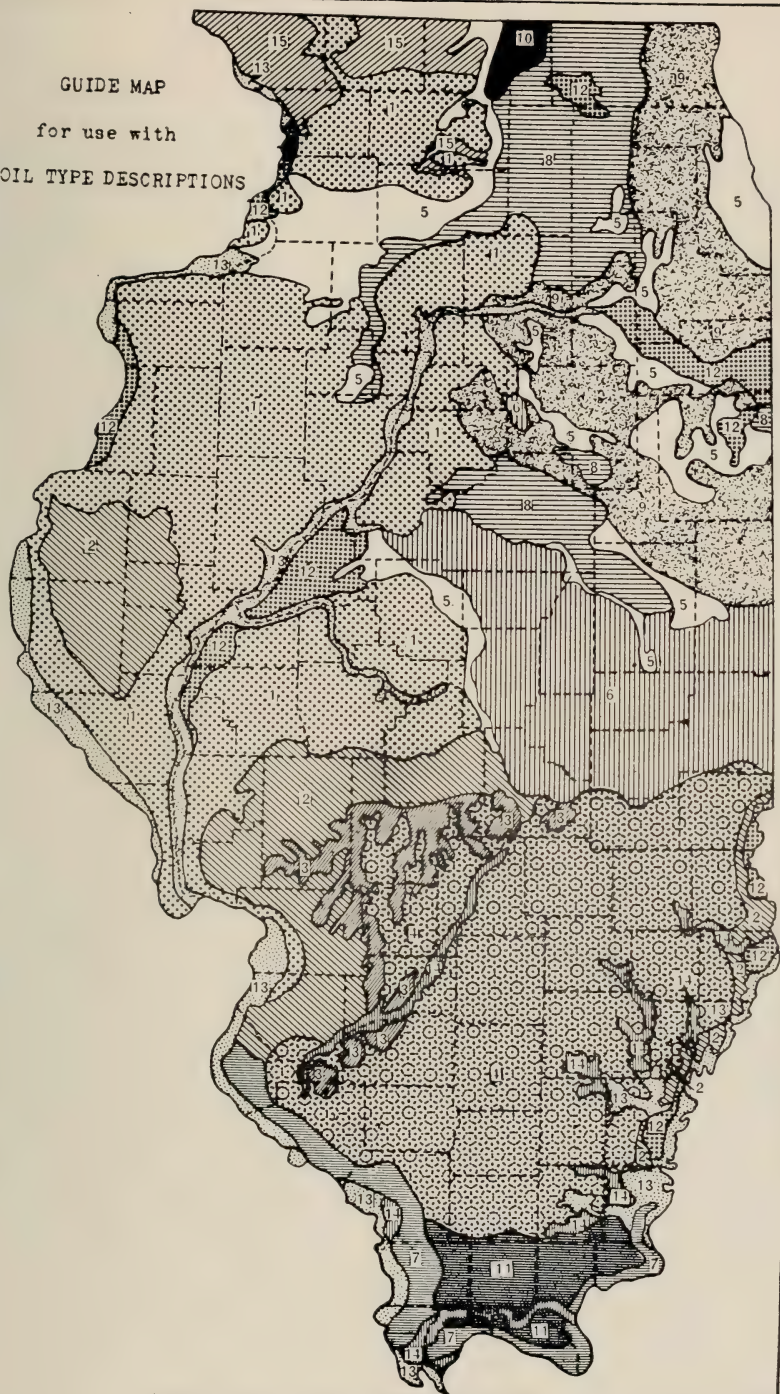

## SOIL TYPE DESCRIPTIONS

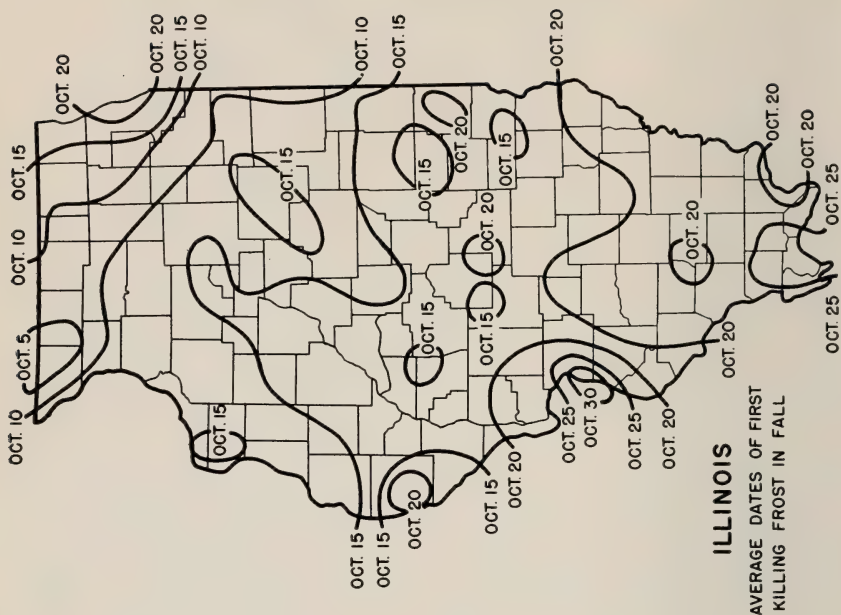

For use with "Guide Map" shown on opposite page

---

1. Dark-colored and light-colored upland soils derived from deep loess.
2. Grayish brown prairie and timber soils with imperfectly developed claypan subsoils.
3. Brownish gray strongly leached prairie soils mostly with claypan subsoils.
4. Gray and yellowish gray strongly leached prairie and timber soils mostly with claypan subsoils.
5. Dark- and light-colored moderately leached soils developed on glacial outwash and old lake bed sediments.
6. Dark- and light-colored moderately leached soils developed from thin loess on permeable Wisconsin till.
7. Yellowish gray timber soils developed from deep loess with subsoils of medium permeability.
8. Dark- and light-colored soils, calcareous at 25 to 40 inches, developed from permeable Wisconsin till.
9. Dark- and light-colored moderately leached soils developed on slowly permeable Wisconsin till.
10. Dark- and light-colored moderately leached soils developed from very thin loess on moderately leached Illinoian till.
11. Soils of the Ozark uplift, largely undifferentiated.
12. Undifferentiated soils developed on glacial outwash plains and river terraces, frequently sandy and drouthy.
13. Undifferentiated dark-colored soils developed from stream sediments.
14. Undifferentiated light-colored soils developed from stream sediments.
15. Undifferentiated dark- and light-colored soils, rock outcrops frequent.

<sup>1</sup> By law, estimates of TOTAL PRODUCTION of apples were discontinued with the 1938 crop. See following tables for comparison with series relating to commercial production.<sup>2</sup> Excludes apples not harvested on account of economic conditions, and/or harvested but not utilized because of abnormal cullage: 1926-145,000 bushels; 1937-150,000 bushels.

Table 87—APPLES (commercial)<sup>1</sup>: Bearing acreage, production, farm disposition, and value, Illinois, 1934-44

1944-----	121	11.7	14,157	4,788	2.87	75	137,538	16,732	154,270

<sup>1</sup> Computed from the value of milk, cream and farm butter sold divided by the quantity of milk or butterfat used in the preparation of these products for market.

<sup>2</sup> Computed as difference between cash income and gross income from dairy products.

<sup>3</sup> Milk utilized for products sold and for products consumed in the farm household valued at average returns for milk utilized in products sold.

<sup>1</sup> Potatoes; sweet corn for processing; green peas for processing; tomatoes for processing; asparagus; and cabbage.<sup>2</sup> For potatoes a 1910-1914 average price is available. Other vegetable crops adjusted to a 1910-14 base by making their 1924 average price equal to 140, the all crop index for that year.
